Basic Elements

- Dome
 - EOS Space Systems (AU)
- Modified Cassegrain
 - EOS Technologies (USA)
- Primary mirror
 - 1.33m
 - LZOS (Russia)
- Secondary mirror
 - 70cm
 - SAGEM-REOSC (France)
- Corrector lens assembly
 - 3-element corrector
 - SAGEM, Kiwistar (NZ)

SkyMapper Filters

- 6 survey filters: *uvgriz*
 - modified version of SDSS filter set:
 - bigger gap between *u* and *g*
 - addition of narrow *v*
 - large format filters: $309 \times 309 \times 15\text{mm}$
 - *uvgz*: coloured glass
 - *i*: glass + short- λ coating
 - *r*: full dielectric coating
 - *u*: 0.7% red leak @ 7170\AA
 - fabrication described by Bessell et al. 2011

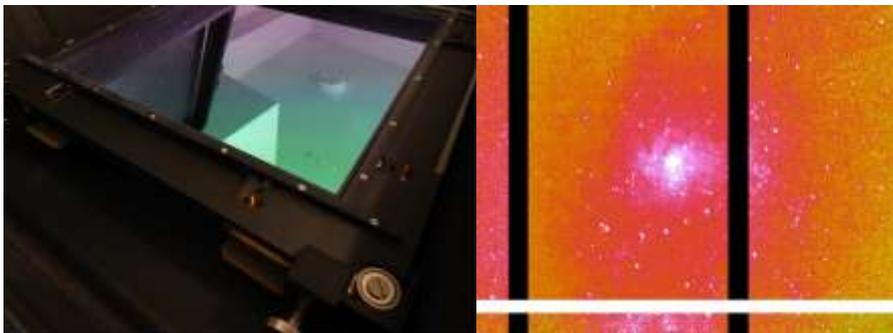

Bessell 2012

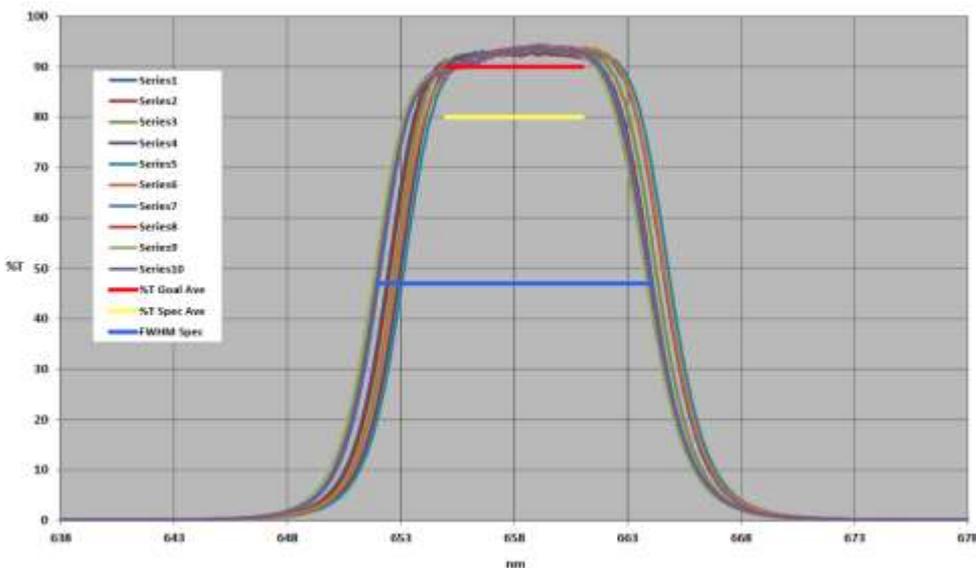

H α Filter

Courtesy G. Bloxham

- New H α filter manufactured by Materion (née Barr)
- First images taken in December 2013
- Quality is excellent
- Filter mechanism only holds 6 filters \rightarrow H α installed for limited periods of time
- Not currently part of Southern Sky Survey

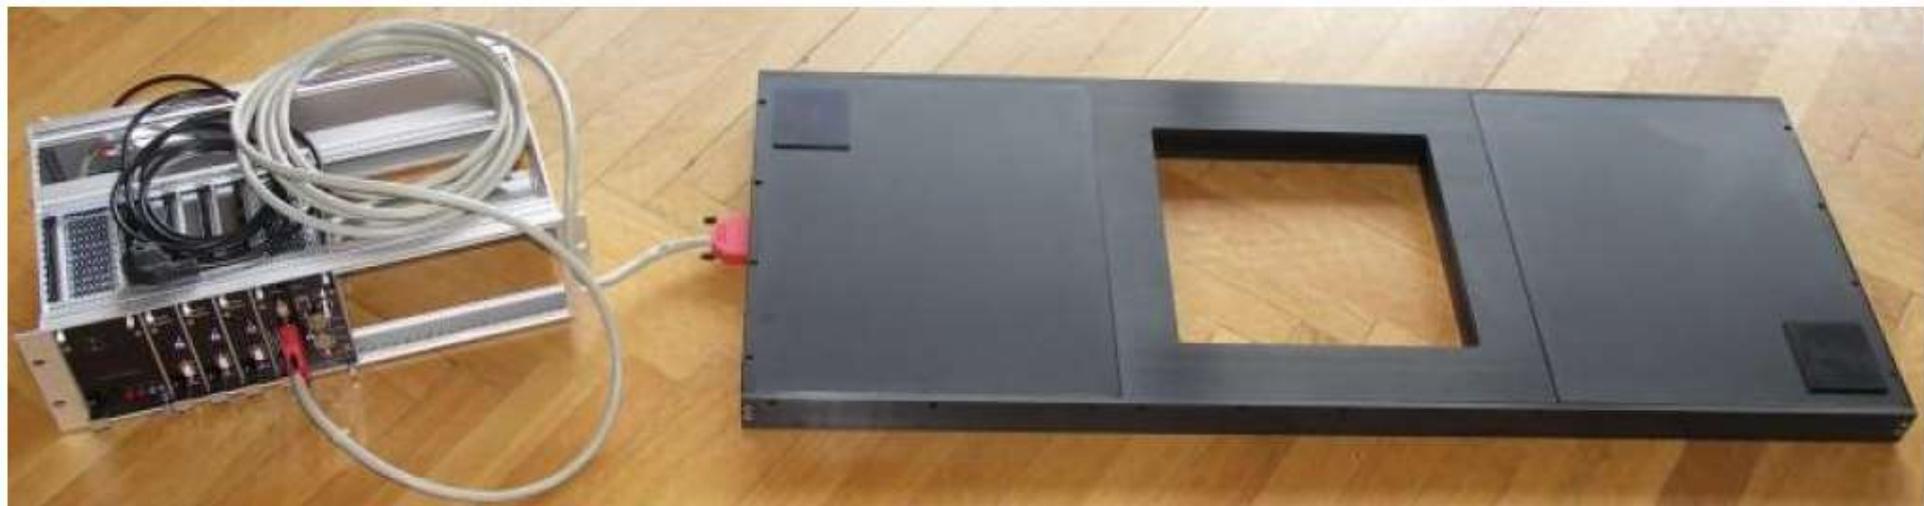

Measured %Transmittance at 0° AOI

Bonn Shutter

- High-precision shutter
 - Designed for exposures as short as 1ms, but system currently limited to exposure time of 1s
 - 0.3% homogeneity
 - University of Bonn

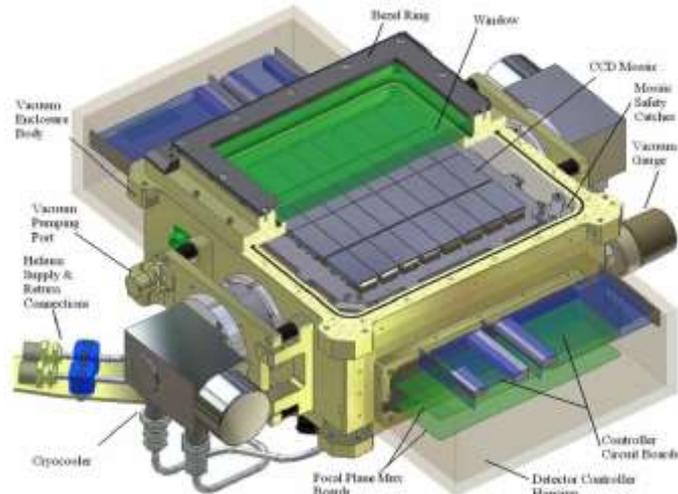

Granlund et al. 2006

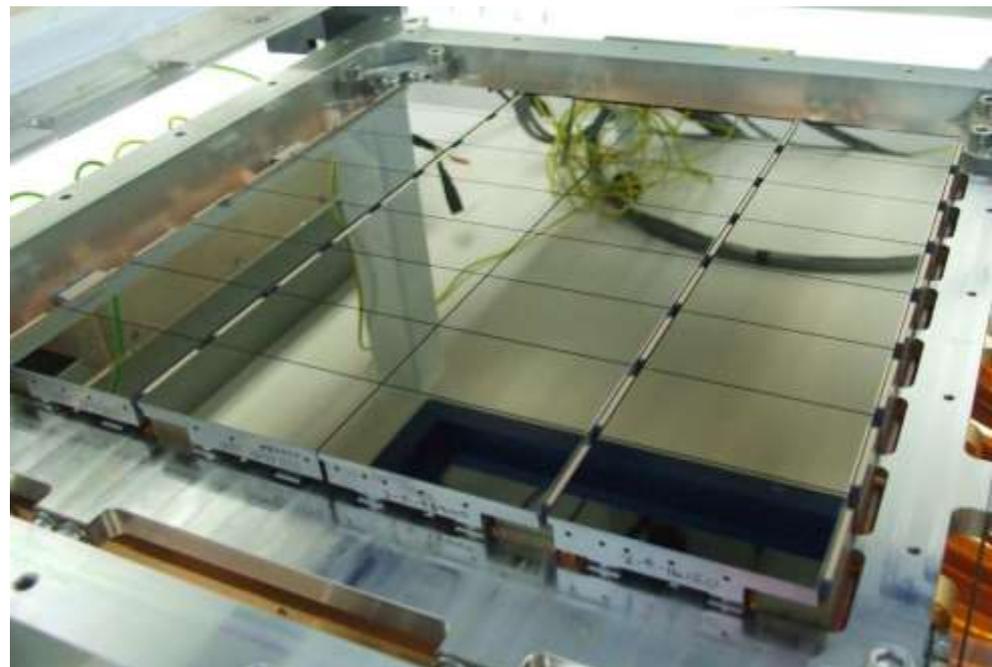

Detector

- 32 $2k \times 4k$ CCDs
 - $15 \mu\text{m}$ pixels, $0.5''/\text{pixel}$
 - 268 million pixels
 - 90% filling of 5.7 deg^2
 - deep-depletion for red sensitivity while limiting fringing
 - e2v 44-82 devices
 - Gain $\approx 1 \text{ e}/\text{ADU}$
 - 2 amplifiers/CCD
- Readout time: 12.09s
- Median time between images: 21s

CHALLENGES ALONG THE WAY

Ladybirds

- 50 kg of ladybird beetles removed from dome

Tracking

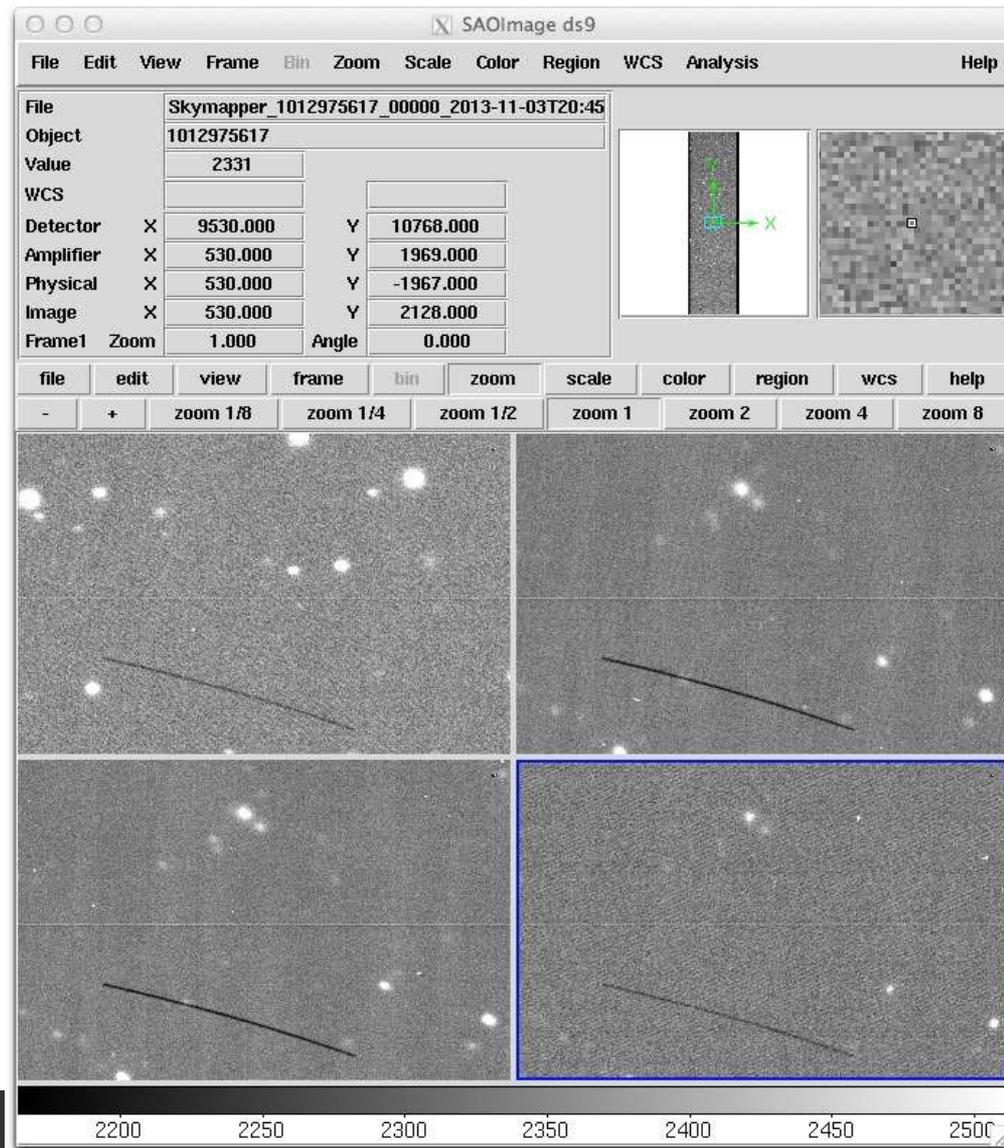

Courtesy I. Adams

150 sec	1500 sec
1500 sec	150 sec

Tracking

- Cleaned elevation and azimuth encoder tapes
- Additional contribution to tracking problems from resource-hogging process on TCS computer

Telescope Vibrations

Primary Clamping

Spider Vane Stiffening

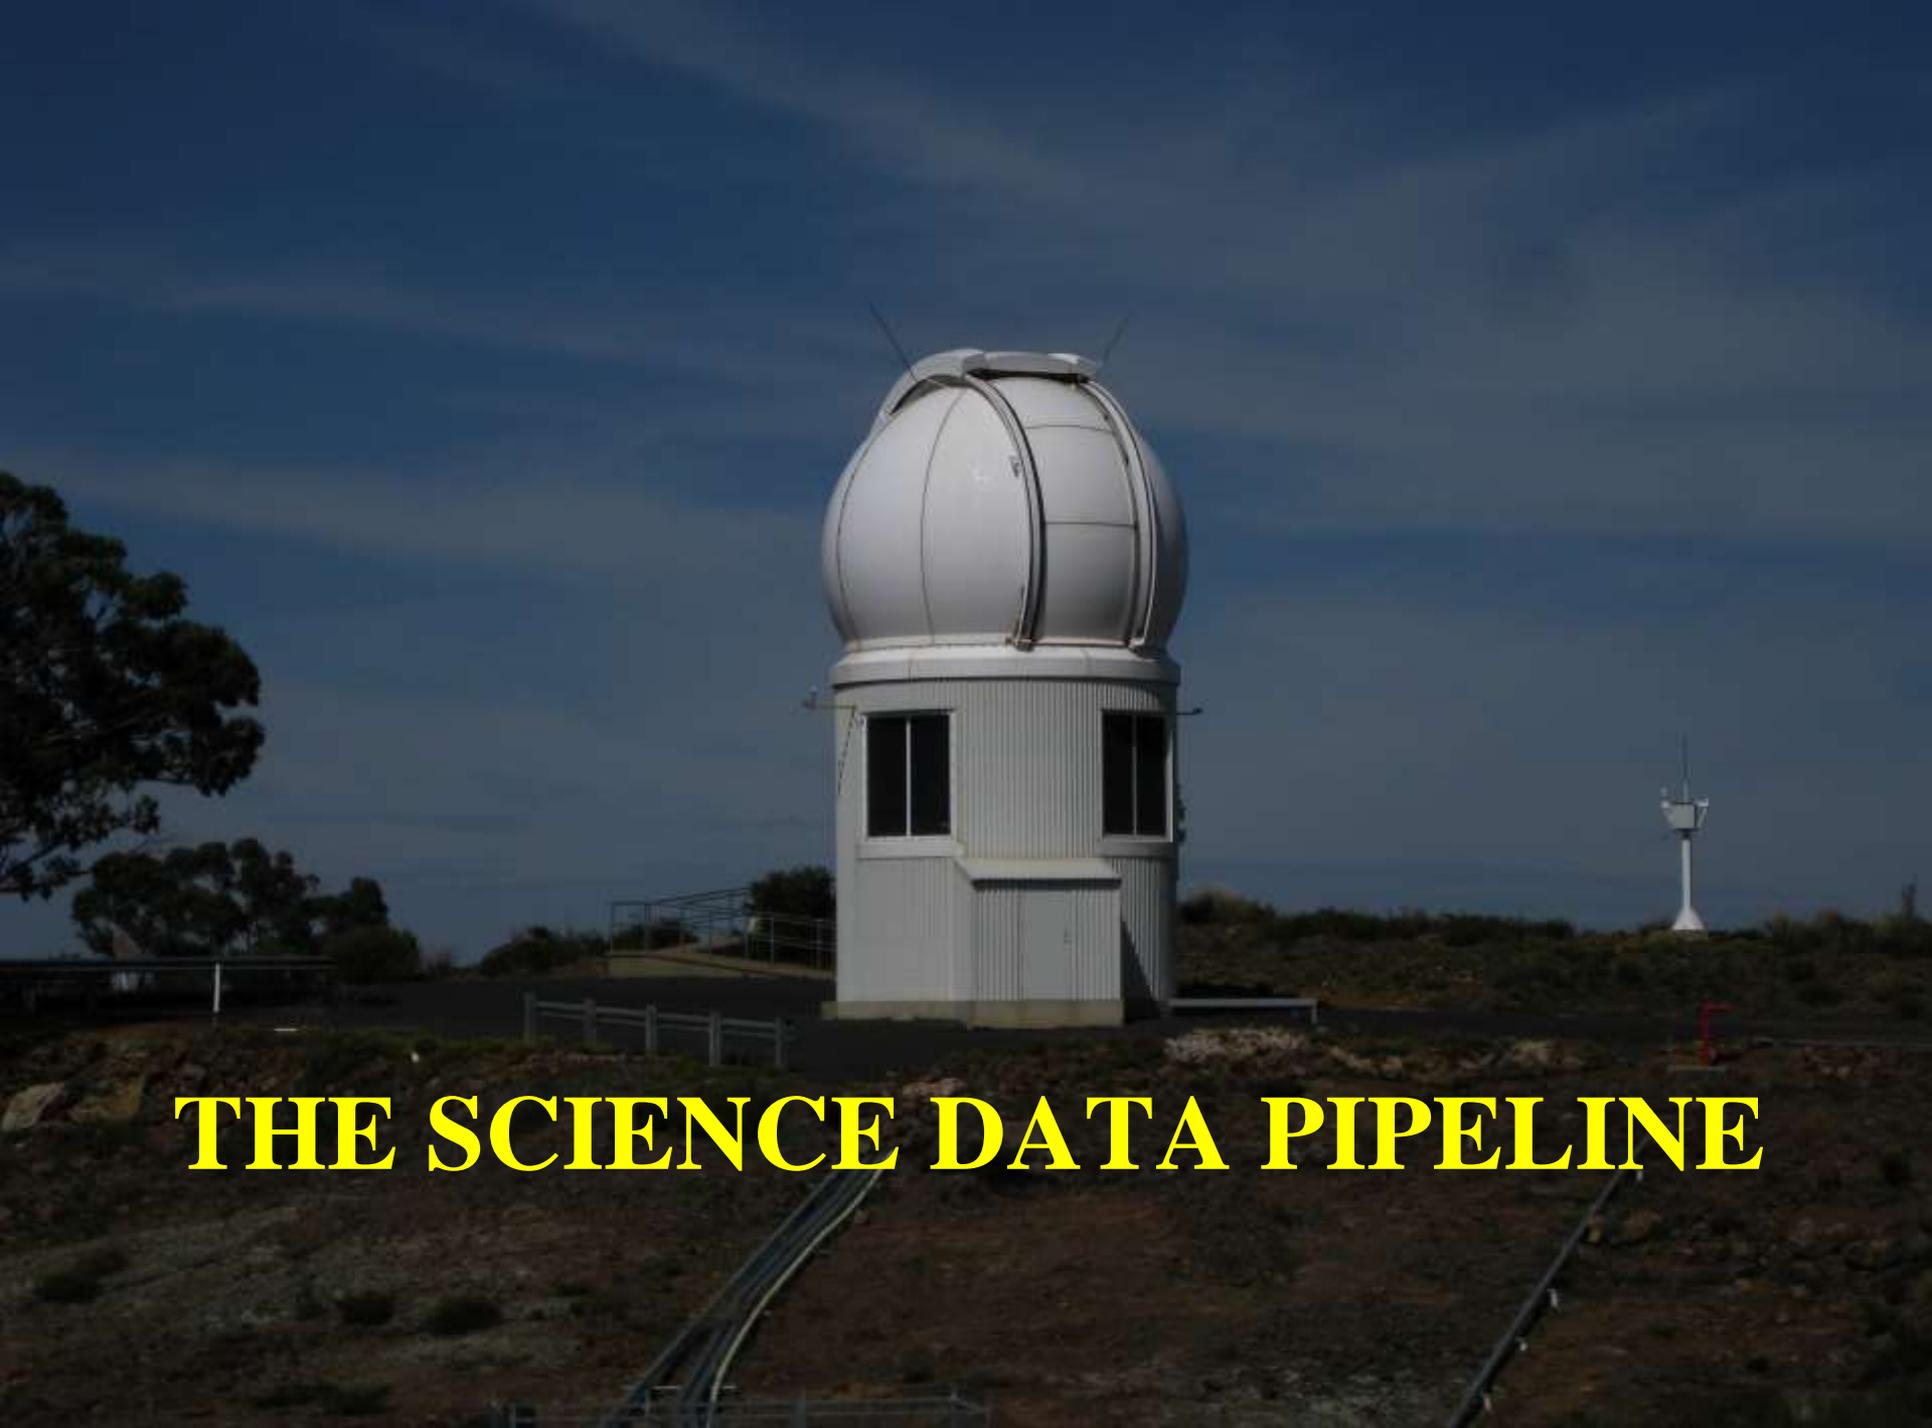

Telescope Automation

- Automatic monitoring of light, clouds, humidity, rain, wind, and system status
- Scheduler queues all calibration and science observations through the night
 - including 3rd-party and Target-of-Opportunity observations
- After morning calibrations, scheduler stops itself and e-mails a nightly summary to Operations staff

THE SCIENCE DATA PIPELINE

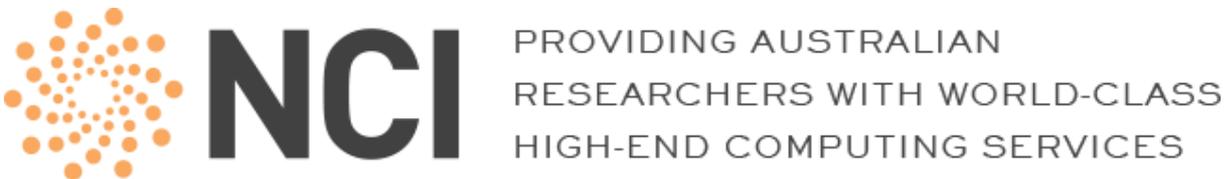

Moving The Pixels

- A winter night's observing could generate 900+ images
 - Each image is 563 MB
- The next morning, raw images get transferred from SkyMapper to the National Computational Infrastructure (NCI) for archiving on “massdata”
 - Current transfer rates fluctuate between 15 MB/s and 50 MB/s
 - Upgrades of fibre link being considered (led by CSIRO for VLBI science)

- Current model:
 - Pull data from massdata to an active filesystem (“short”)
 - Process through the SDP
 - Archive results to massdata

- Forthcoming model:
 - Pull data to new SDP server at RSAA
 - Process through the SDP
 - Archive results to massdata

Data Prep

- Nights are processed as a unit
- Each image is ingested into the SDP
 - From 64 extensions in each integer FITS image, data are merged into 32 floating-point FITS images (one per CCD)
 - Overscan correction (by-line fit to pre- and post-scan)
 - Trimmed to science region
 - Saturation and cross-talk are flagged in bad pixel mask
 - Cross-talk ($\sim 0.05\%$) is corrected
 - Basic image info is recorded in SDP database

Calibrations

- Biases
 - created, but not currently applied in the SDP
- Flats
 - evening and morning twilight flats taken when possible
- Fringes
 - generated for reddest filters from images of sparse fields having sufficient exposure time
- Illumination Correction
 - manual process (not created within SDP)

Generated for each night with sufficient number of input images

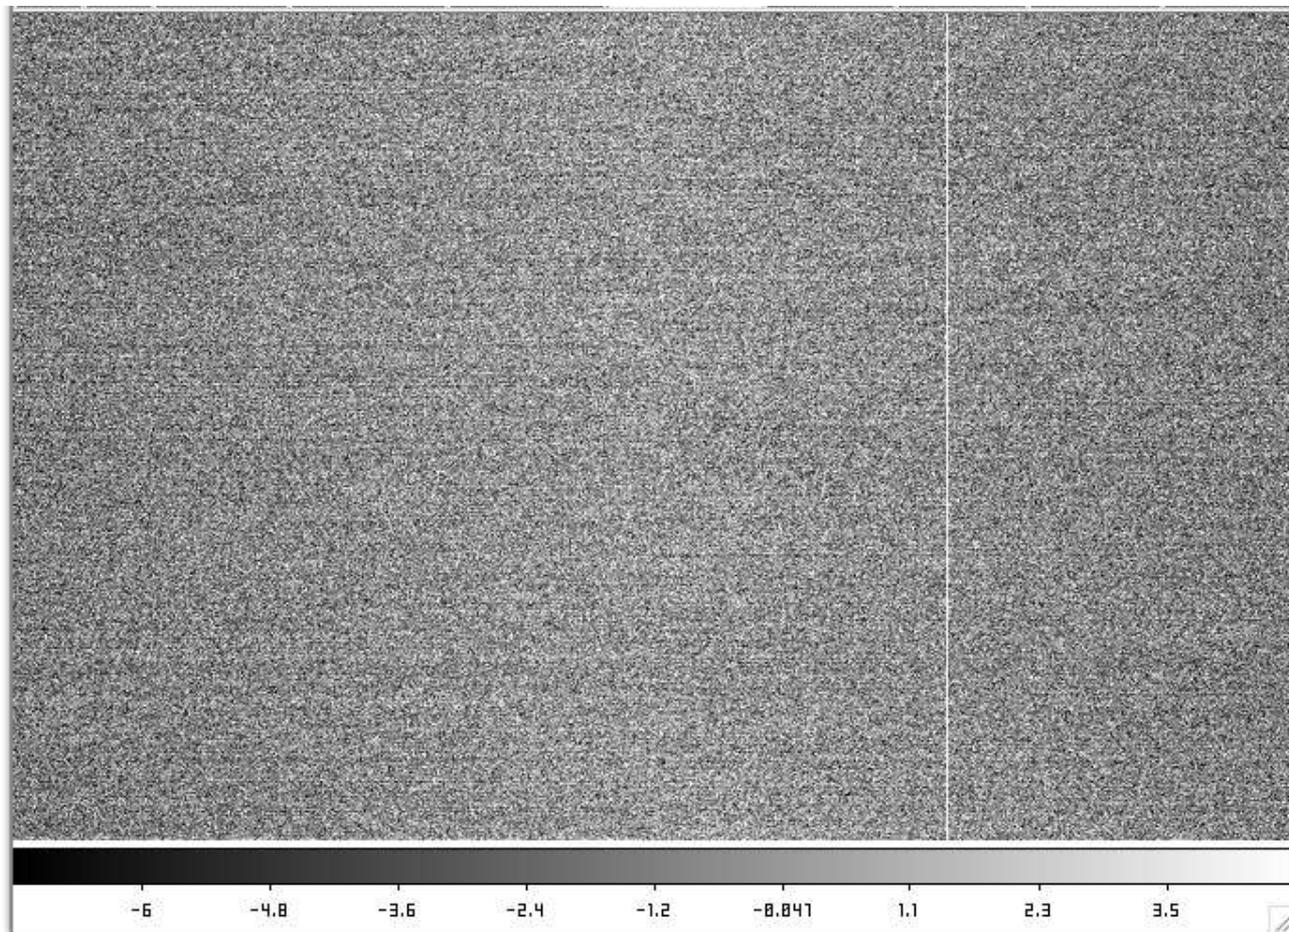

Compared against previous “approved” calibration (valid up to 30 days)

Stats & images presented for SDP-operator consideration

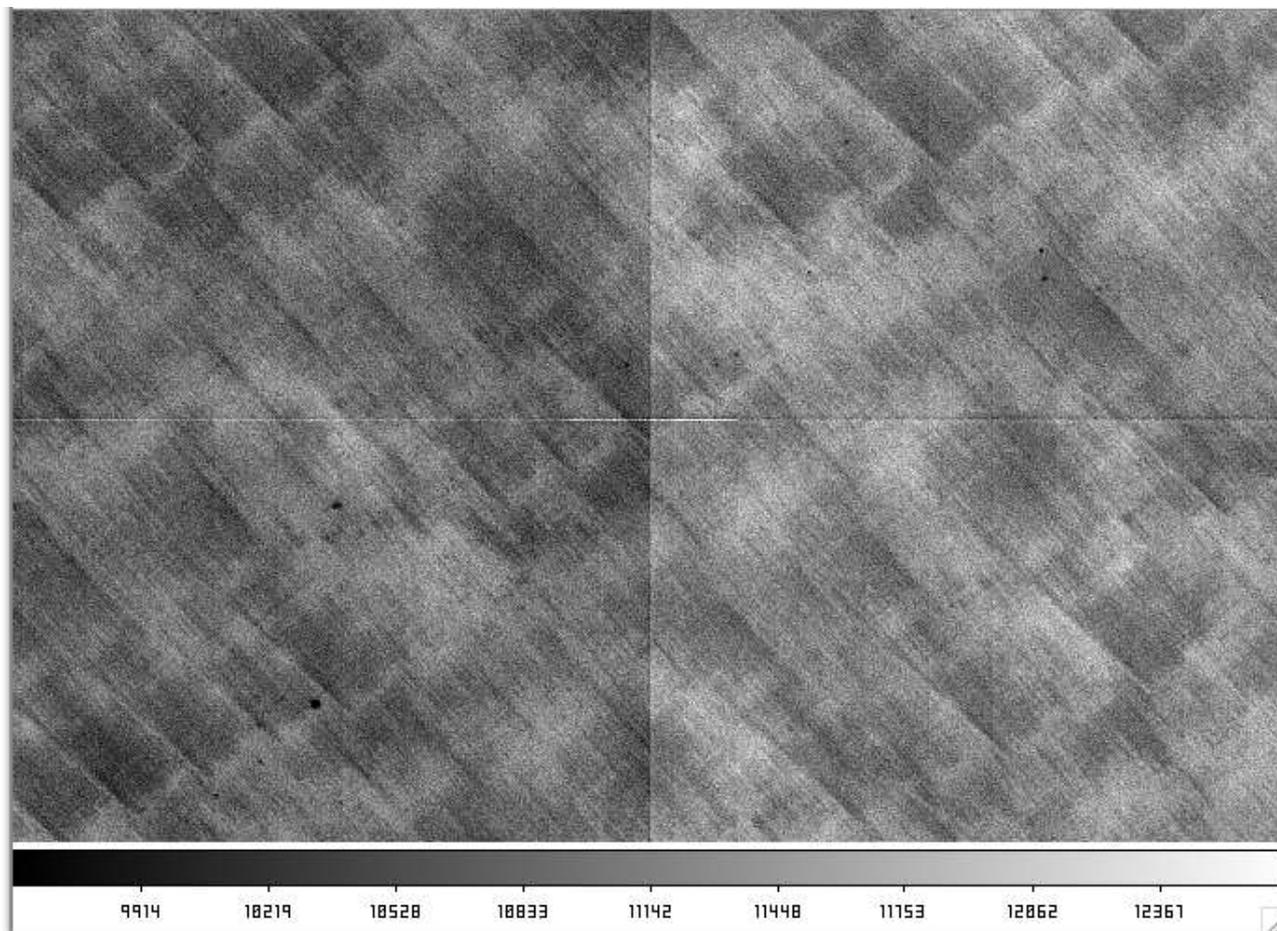

Bias

Flats

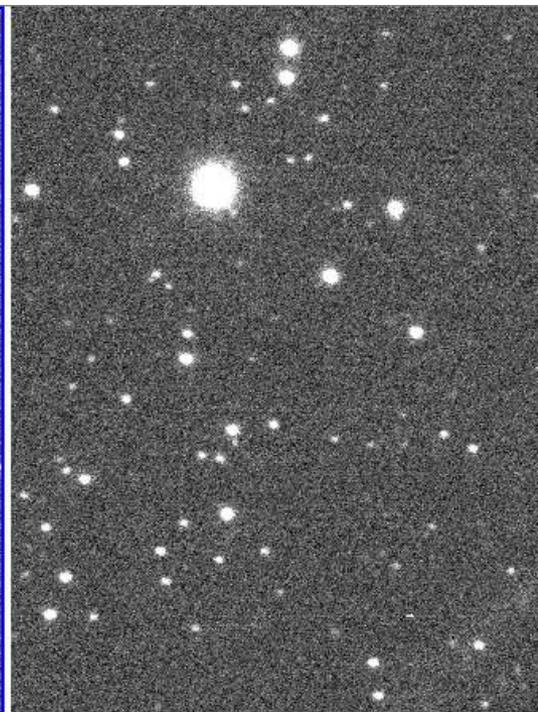

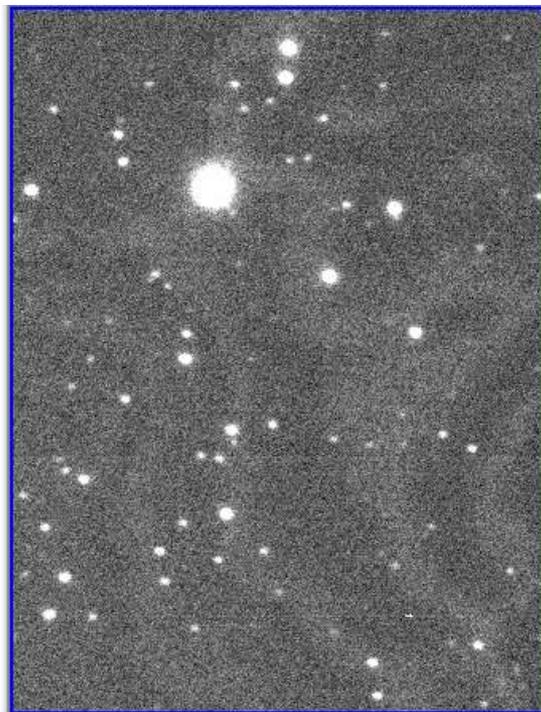

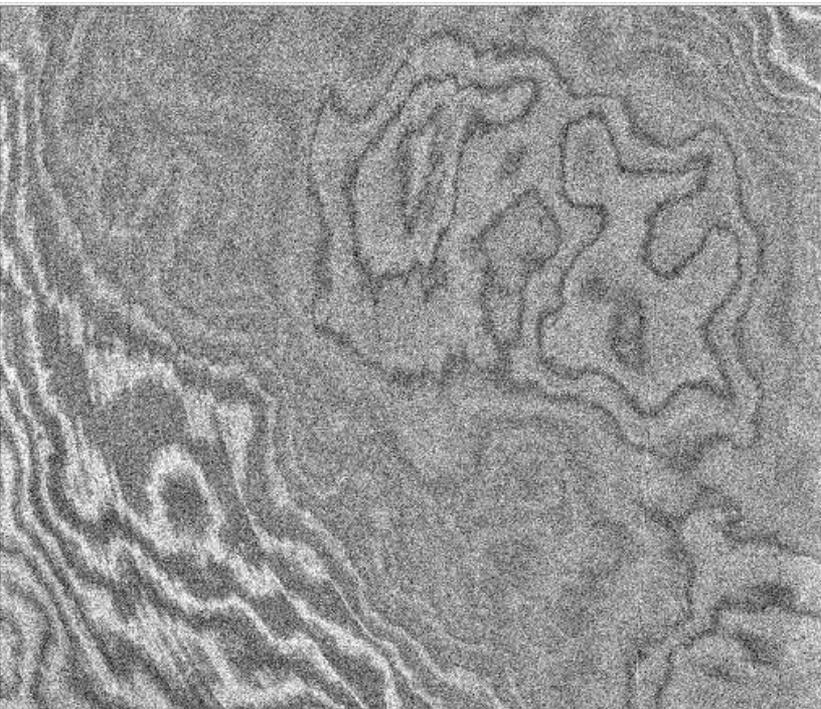

Cross-hatch pattern from laser annealing. Seen in u and v frames.

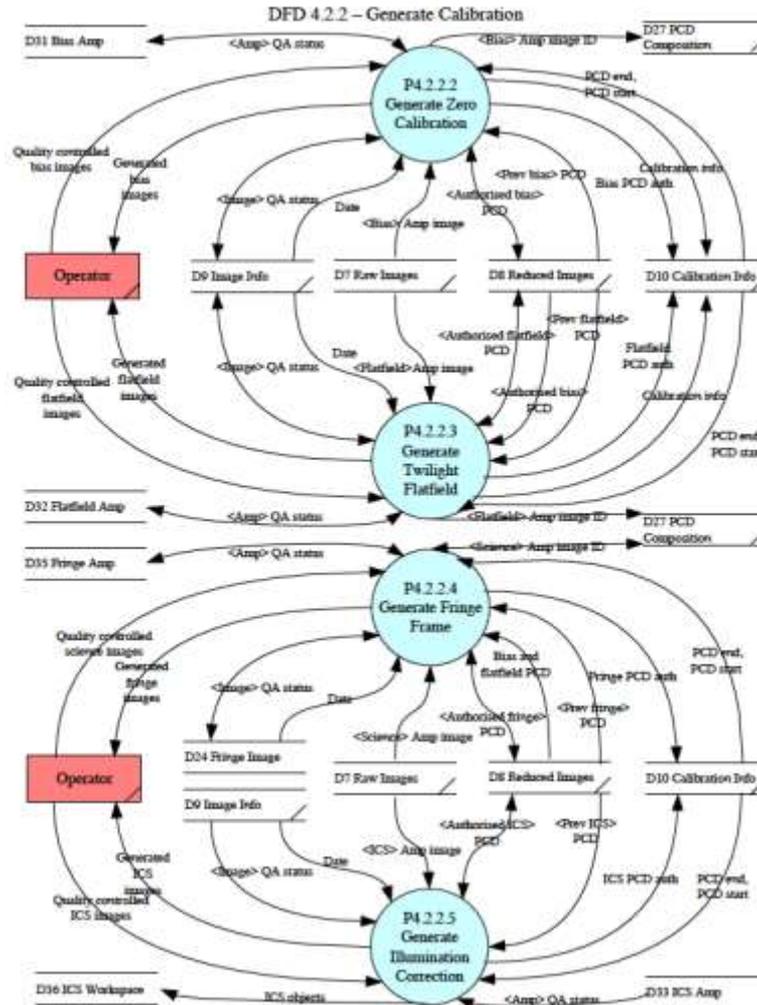

Fringing

z -band

Calibrations

Science Data

- All science images receive basic processing:
 - Corrected for overscan & cross-talk, trimmed, merged into 32 individual images, bad pixel mask created (at SDP ingestion)
 - (Bias frame not currently applied)
 - Flatfielded (including correcting for CCD-to-CCD gain differences)
 - Fringing scaled and subtracted (if applicable)
 - Illumination-corrected

Science Data

- After basic calibration, frames receive preliminary World Coordinate System (WCS) from local installation of Astrometry.net
- Customised version of Source Extractor measures astrometry and photometry
- Compare against 2MASS catalogs
 - generates final WCS solution, accounting for distortions in focal plane via TNX parameterisation (tangent projection + polynomial terms)
 - photometric zero-point estimated using catalog sources with $(J-K)=0.3-0.6$ [G/K stars]

End of First SDP Phase

- For each original science image, we now have
 - 32 overscan-corrected, cross-talk-corrected, flatfielded, de-fringed, illumination-corrected, WCSed images with rough zero-points
 - $33.6 \text{ MB} \times 32 \text{ FITS files} = 1.00044 \text{ GB}$
 - 32 bad pixel masks
 - $8.1 \text{ MB} \times 32 \text{ FITS files} = 256 \text{ MB}$
- **Non-survey images exit the SDP here**
- Standard Field & Short Survey photometry for the night is calculated next
- Main Survey photometry is calculated when a field has a complete dataset
