

The low column density H I Universe

Paolo Serra
CSIRO ATNF

1979: Sancisi & Allen

1997: Swaters et al.

2007: Oosterloo, Fraternali & Sancisi

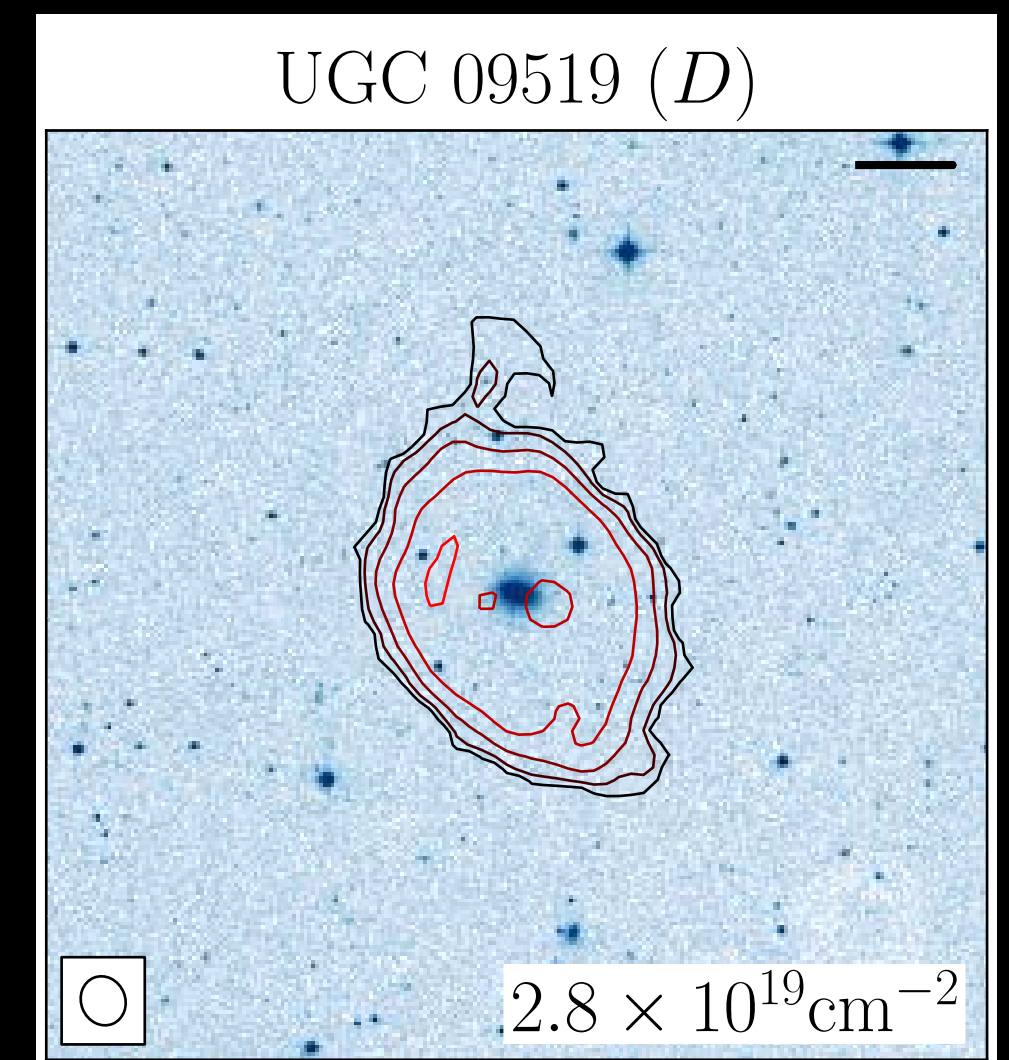

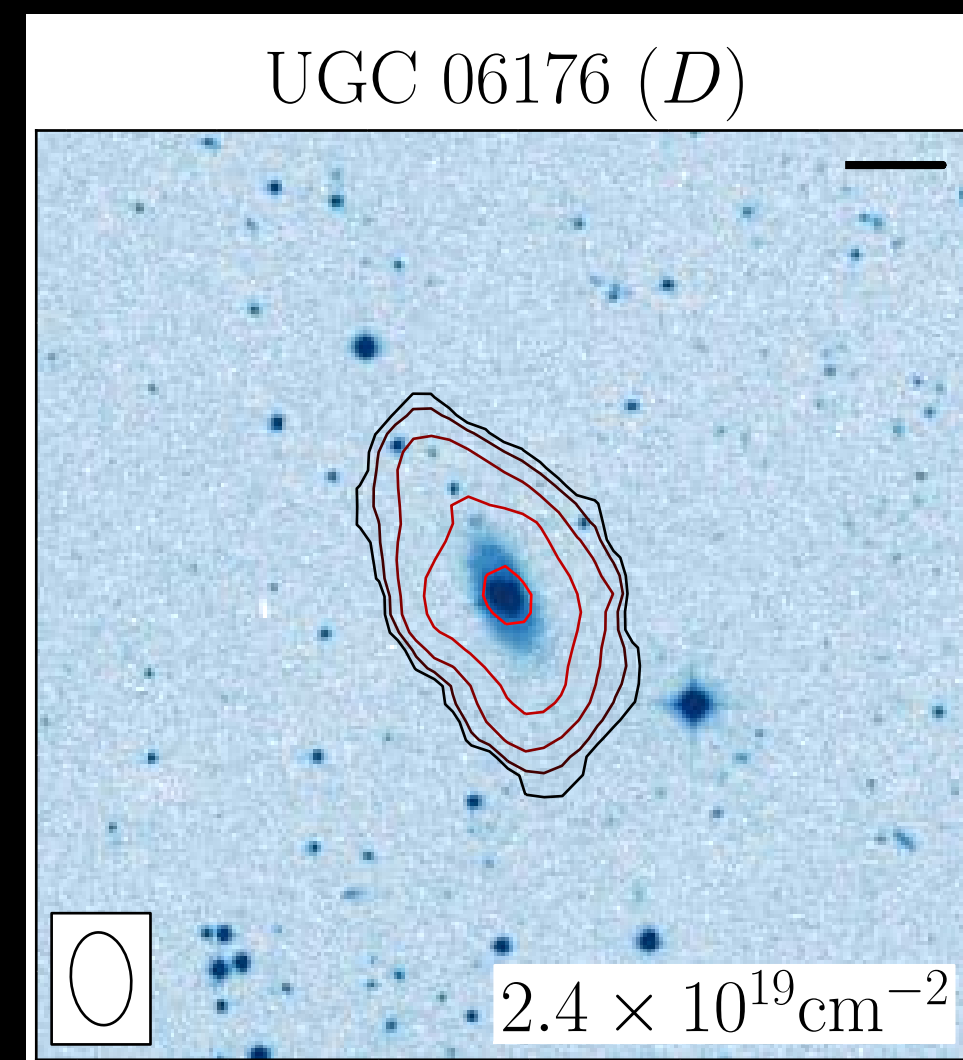

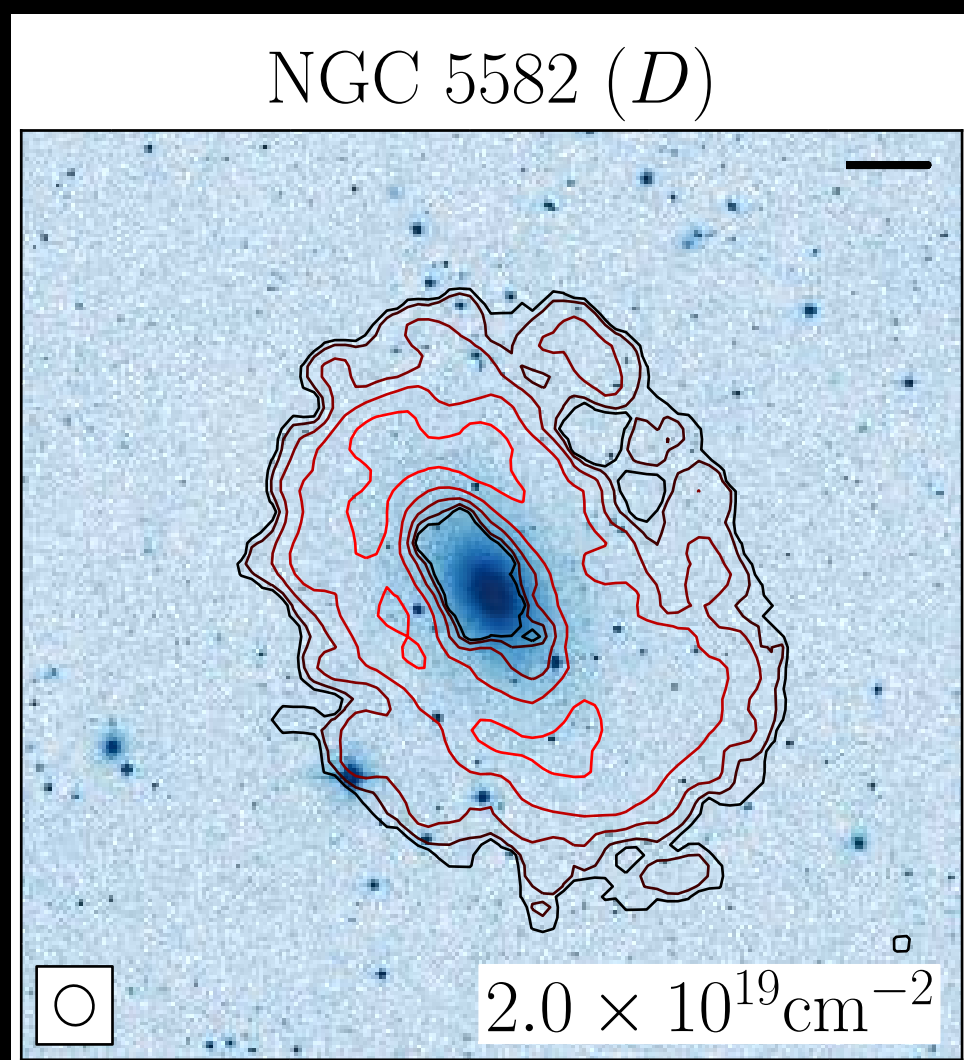

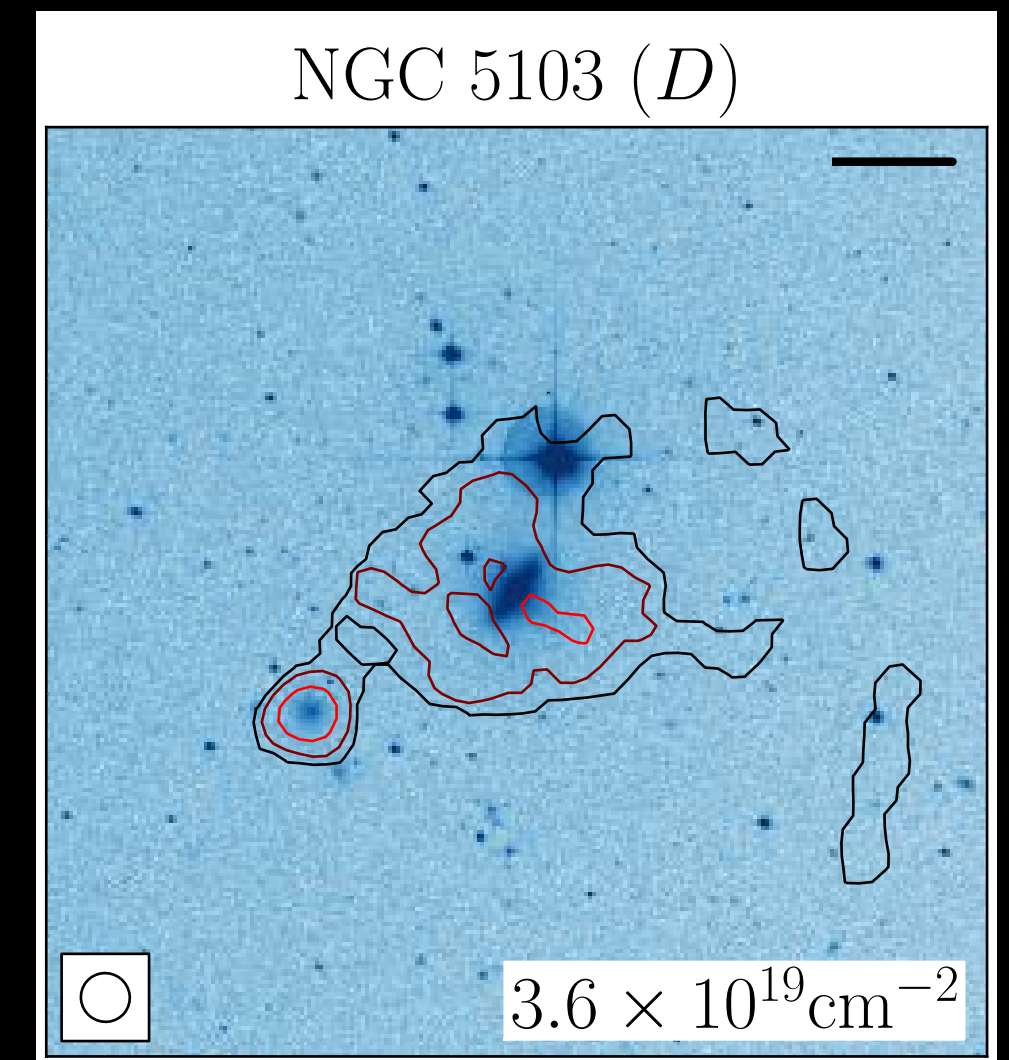

Minimum
column
density

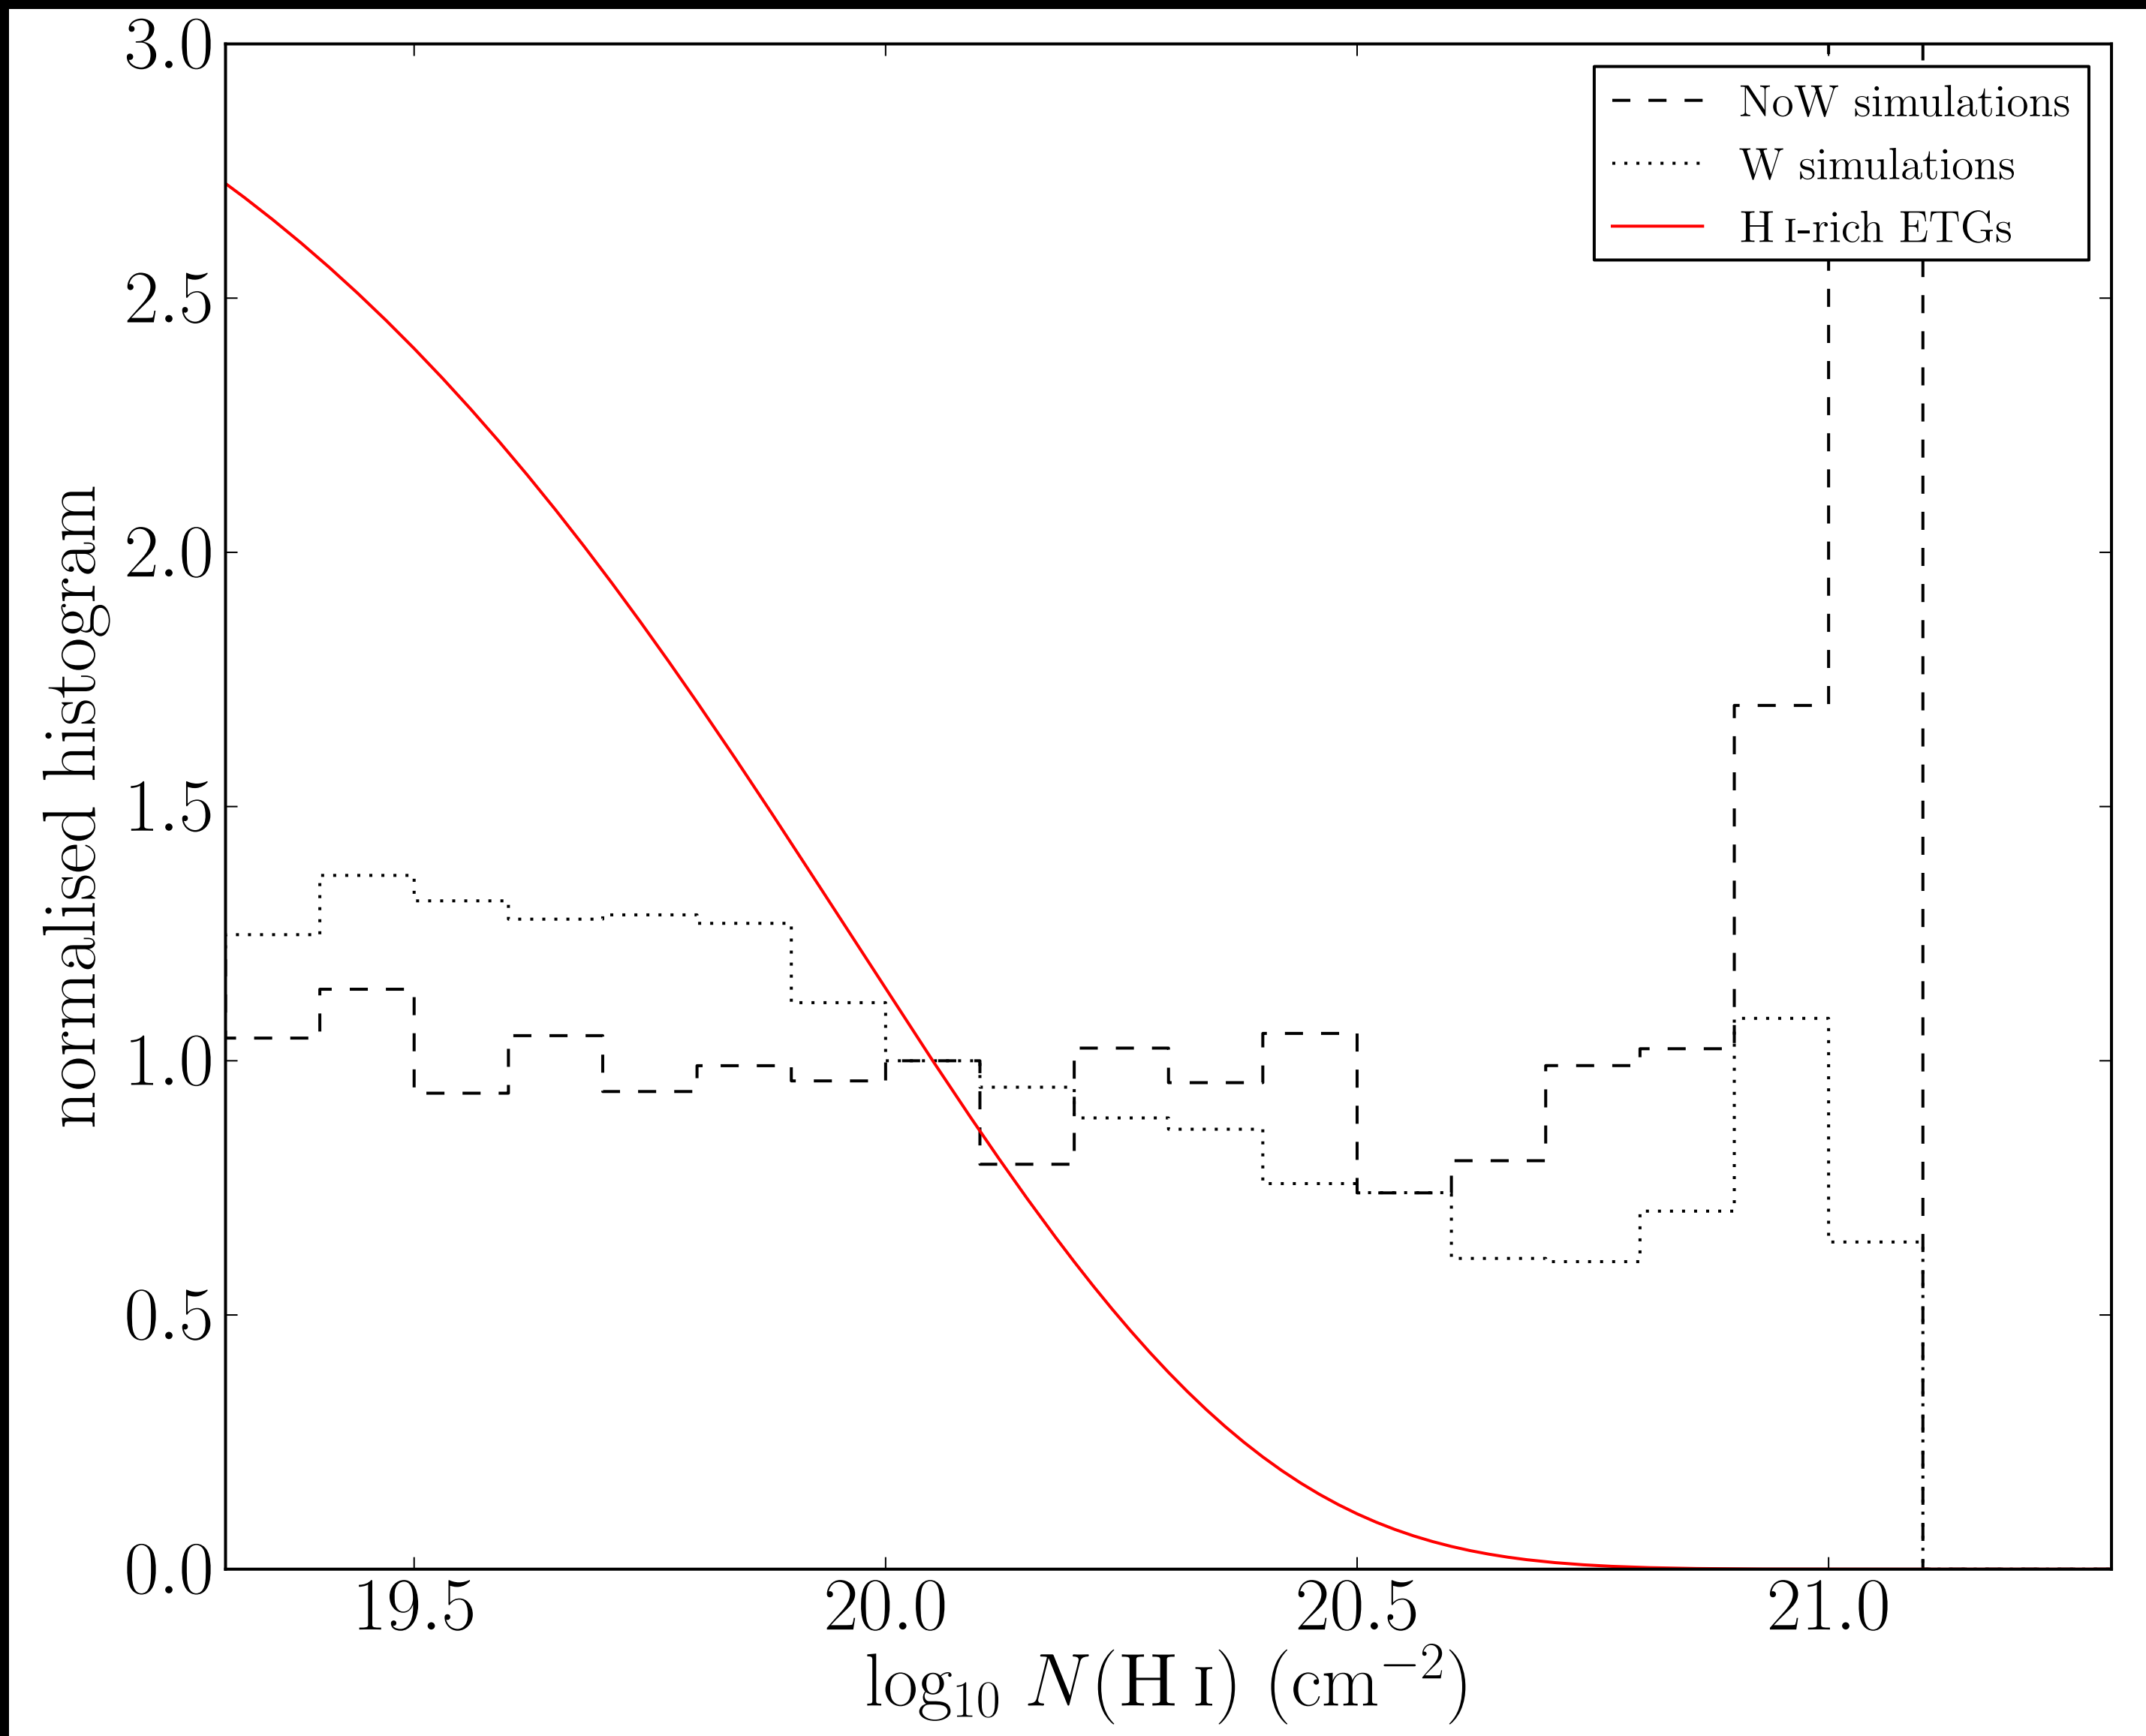

$$\sim 1 \times 10^{21} \text{ cm}^{-2}$$

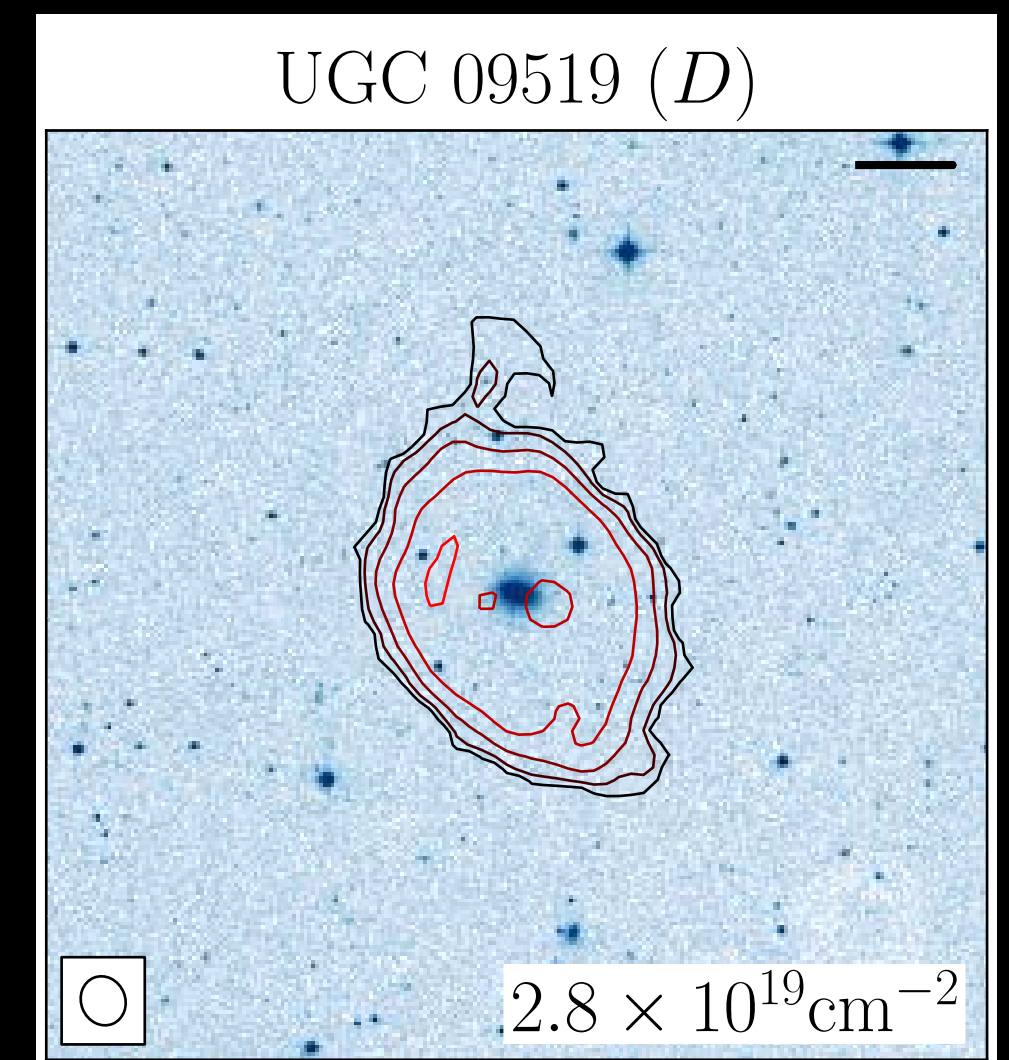

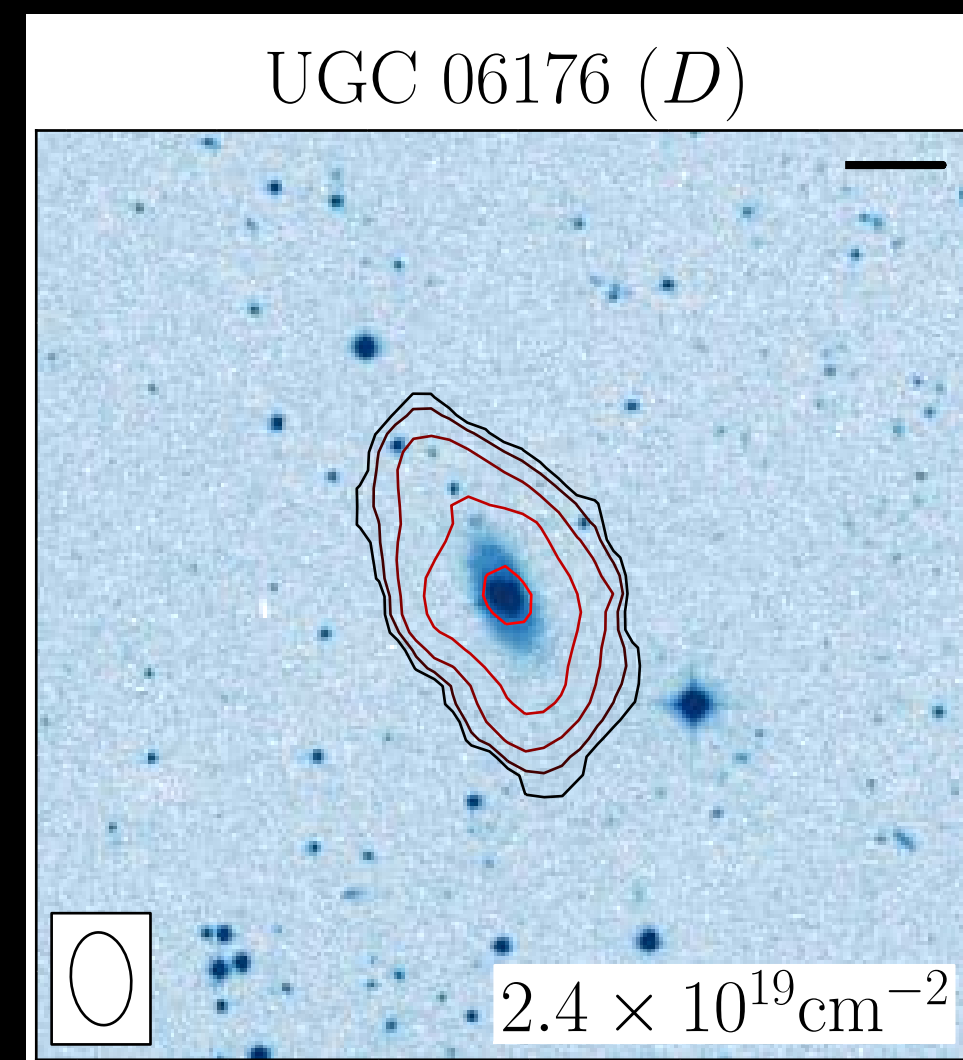

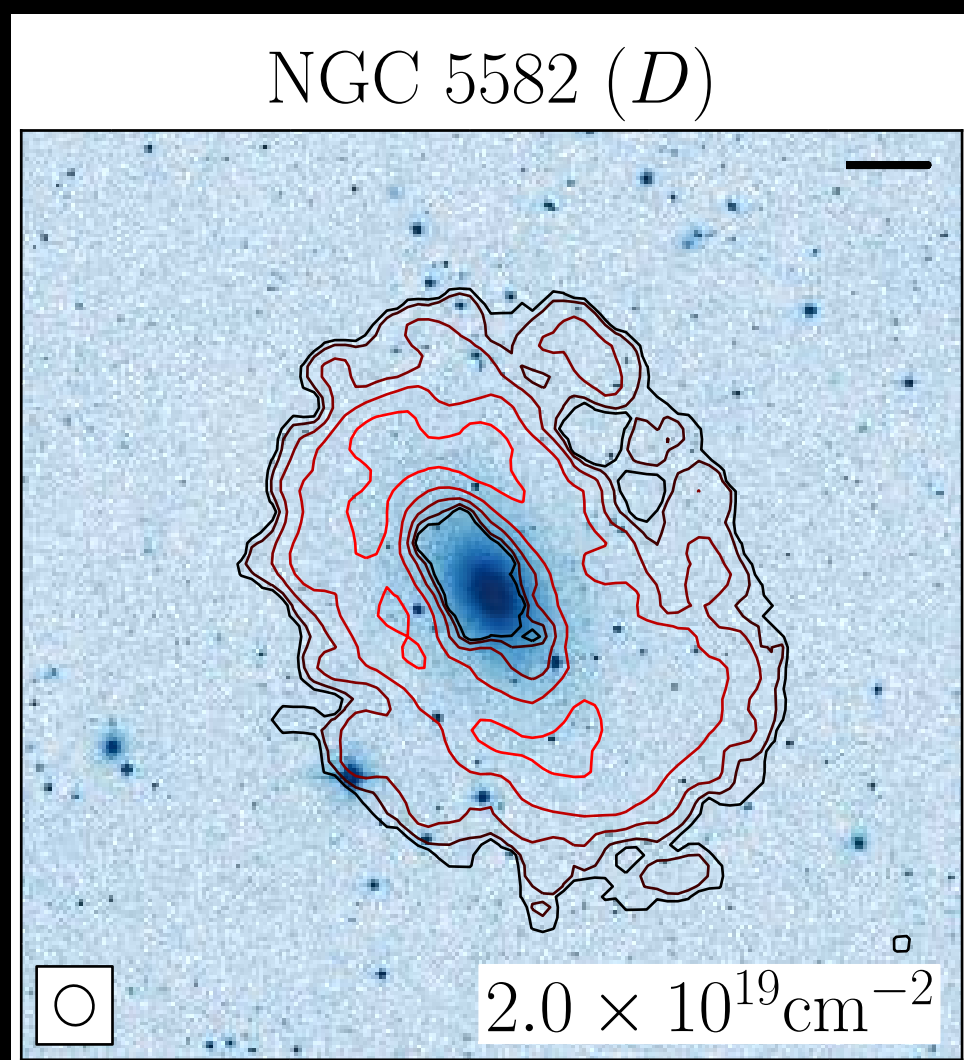

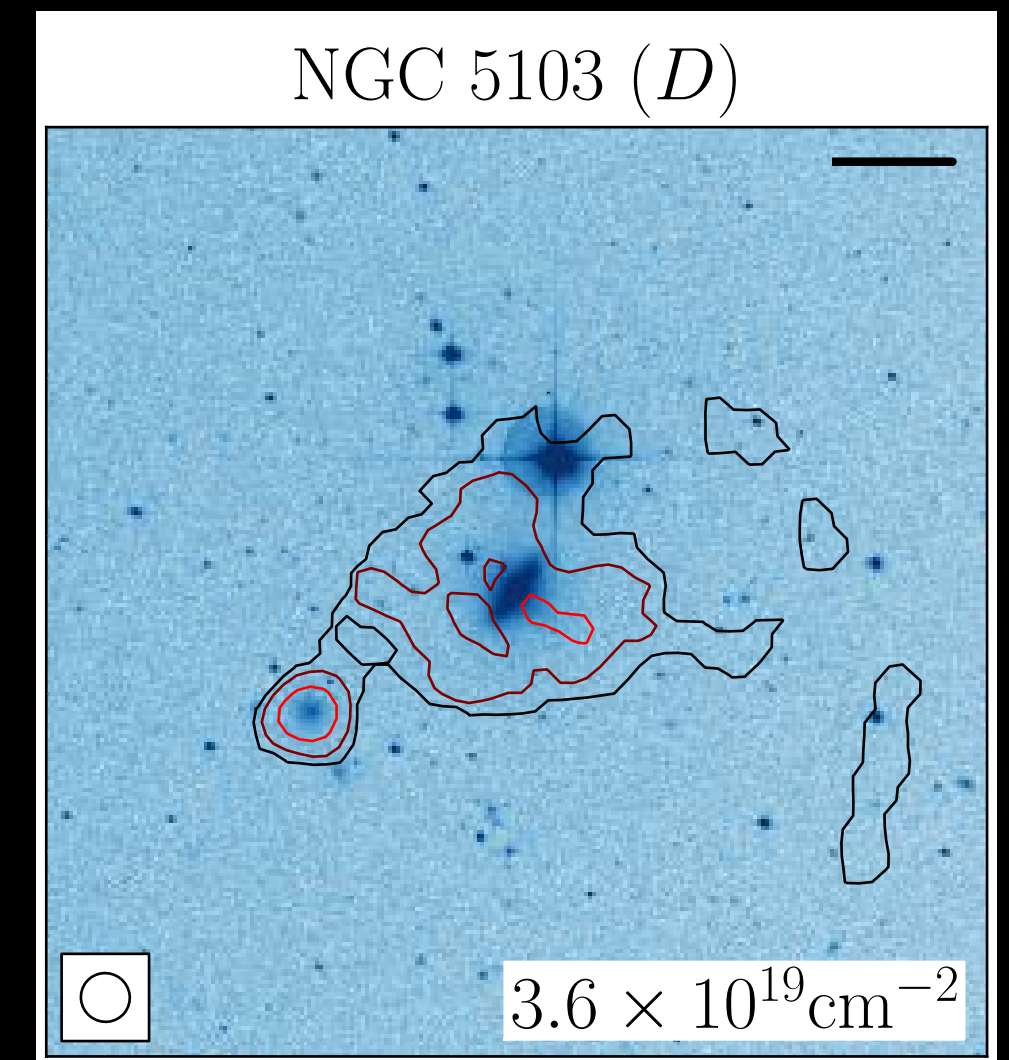

$$\sim 1 \times 10^{20} \text{ cm}^{-2}$$

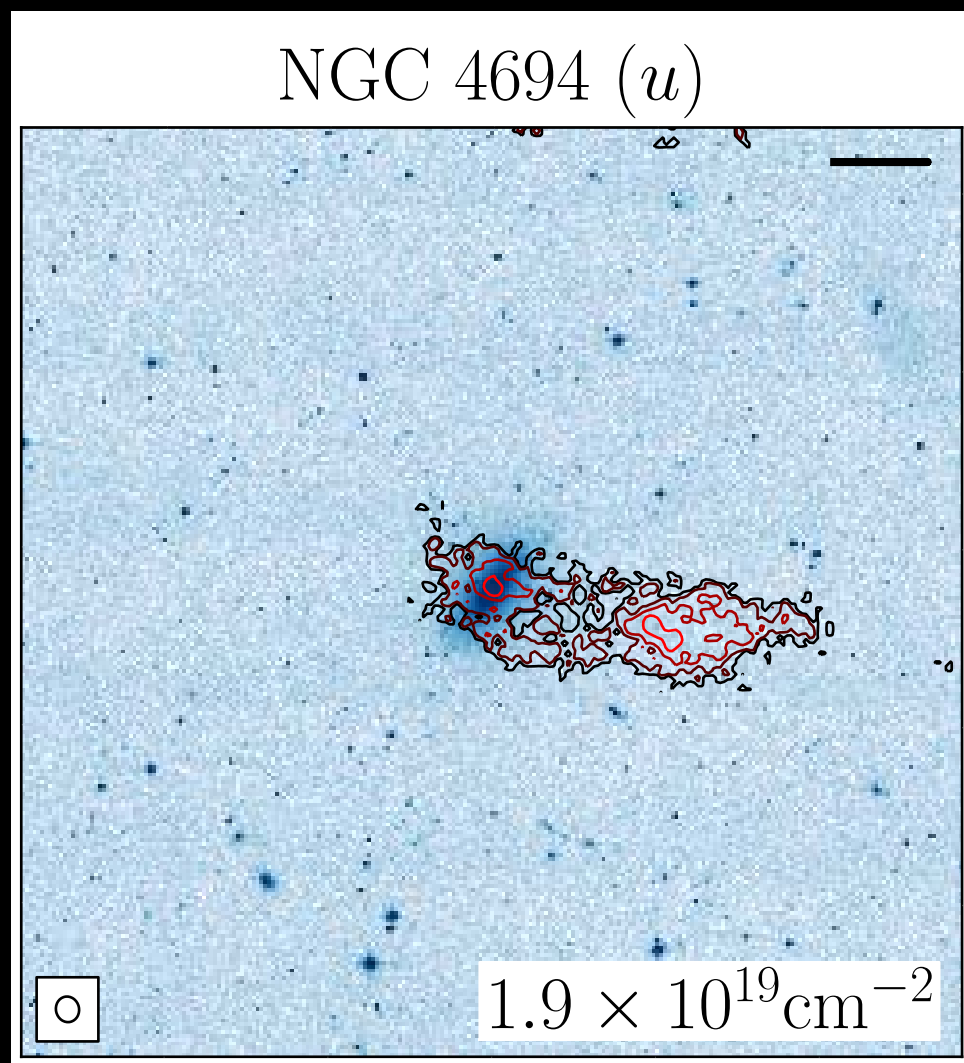

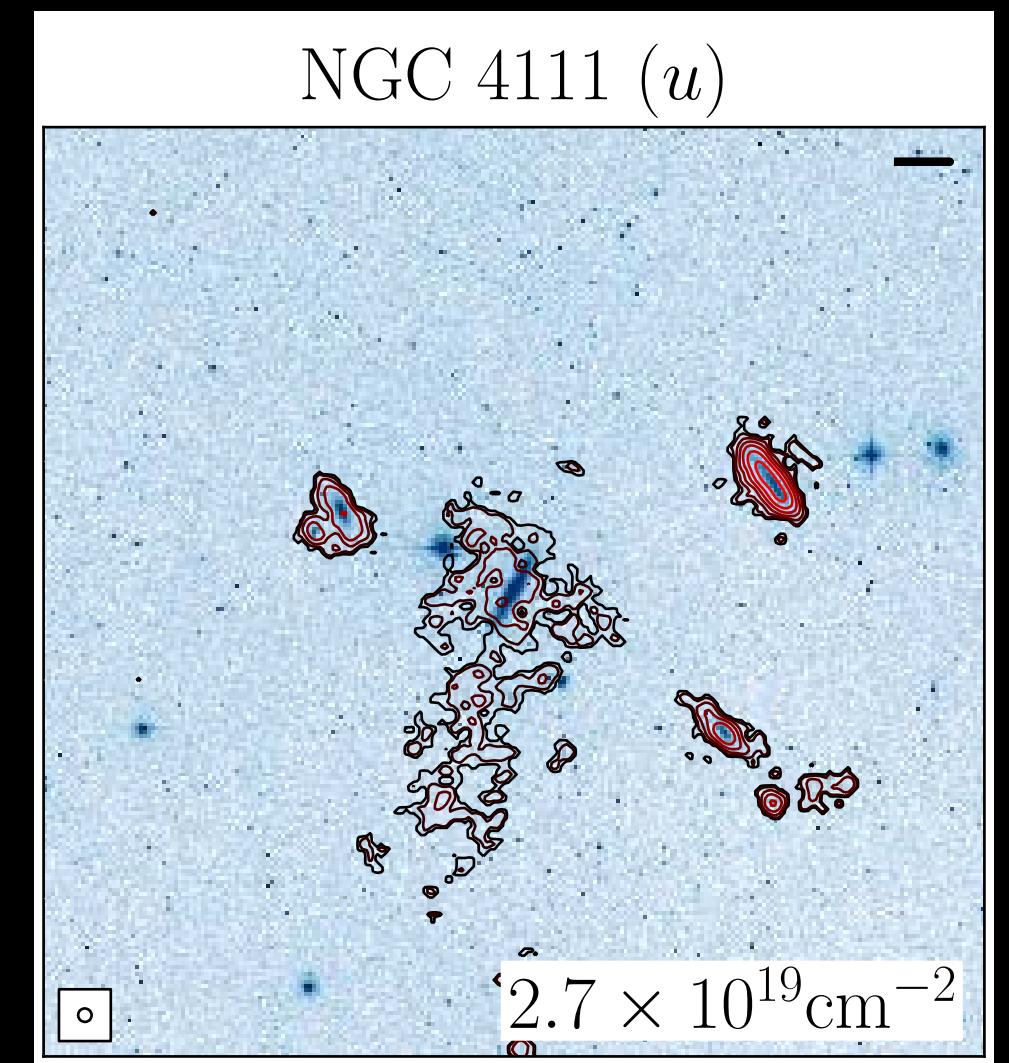

$$\sim 1 \times 10^{19} \text{ cm}^{-2}$$

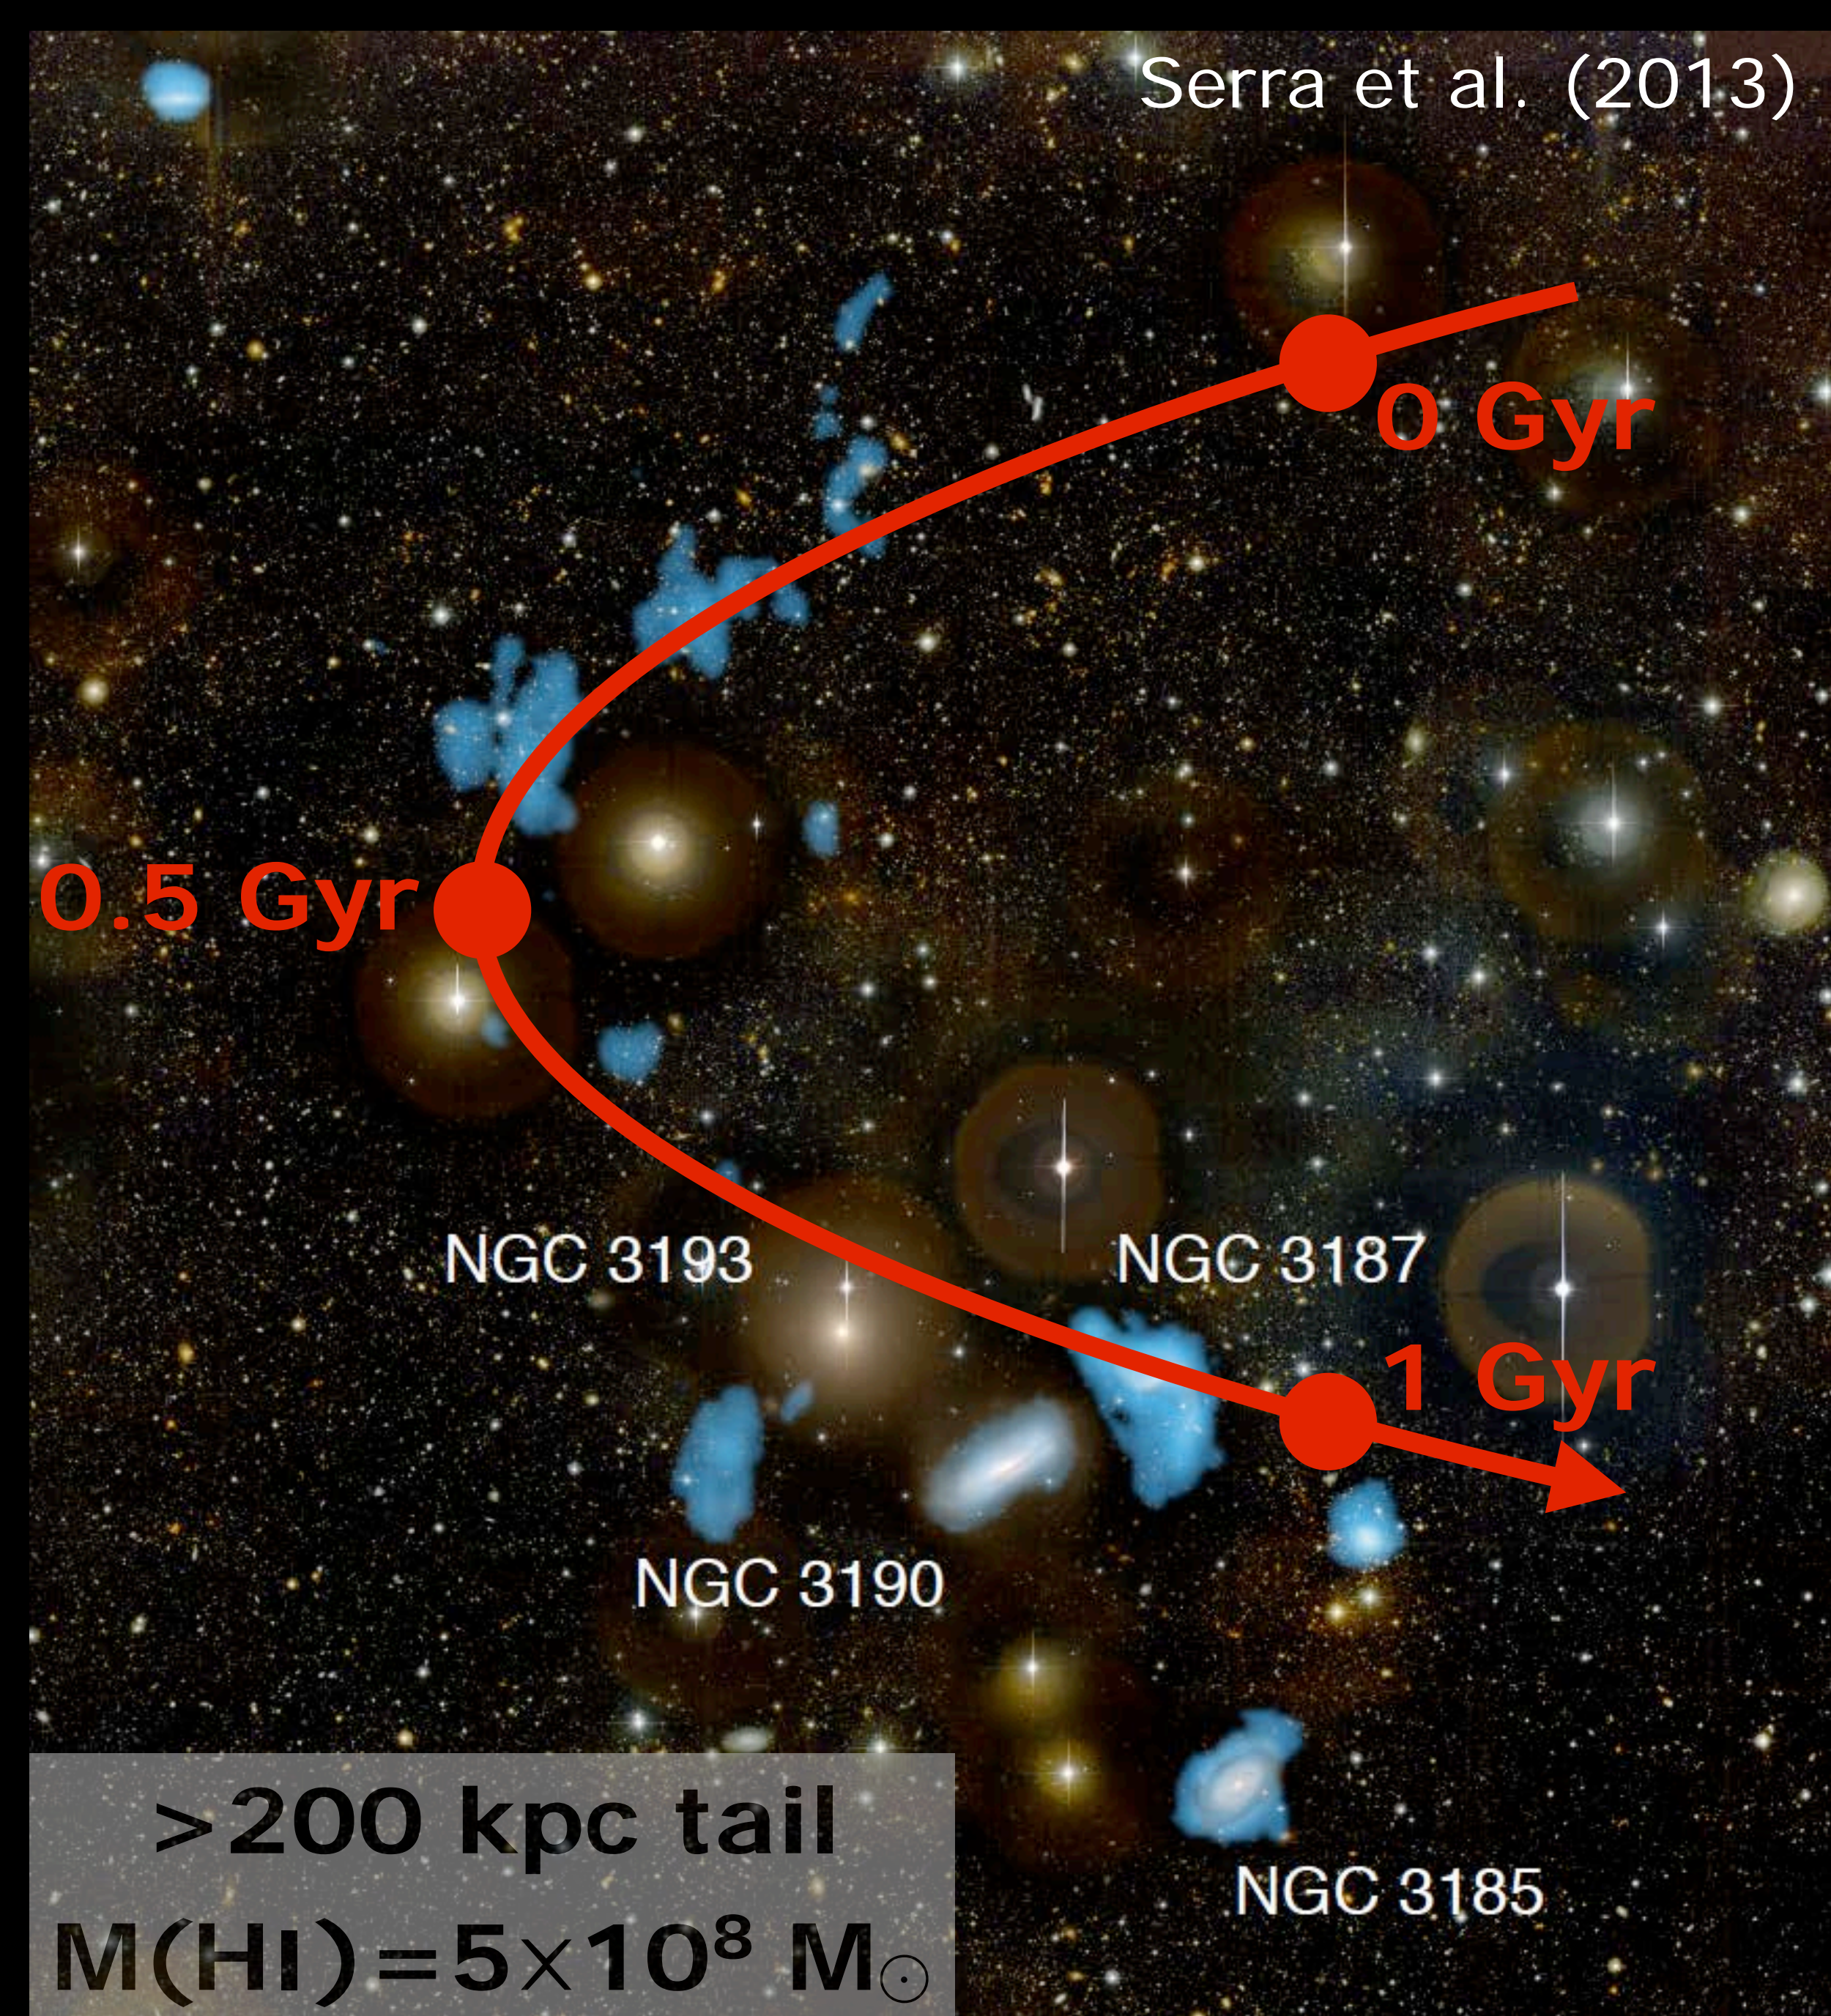

NGC 1427A in the Fornax cluster

Hilker et al. (1997, 2005)
Chaname et al. (2000)
Gregg et al. (2003)

Serra et al. (2013)

Parabolic orbit toy model:
NGC 3187 stripped of 1/3 of
its HI by the group tidal field in
~1 Gyr
(à la Bekki et al. 2005)

MeerKAT HI survey of Fornax

~50 pointings, 2500 h

~11 deg²

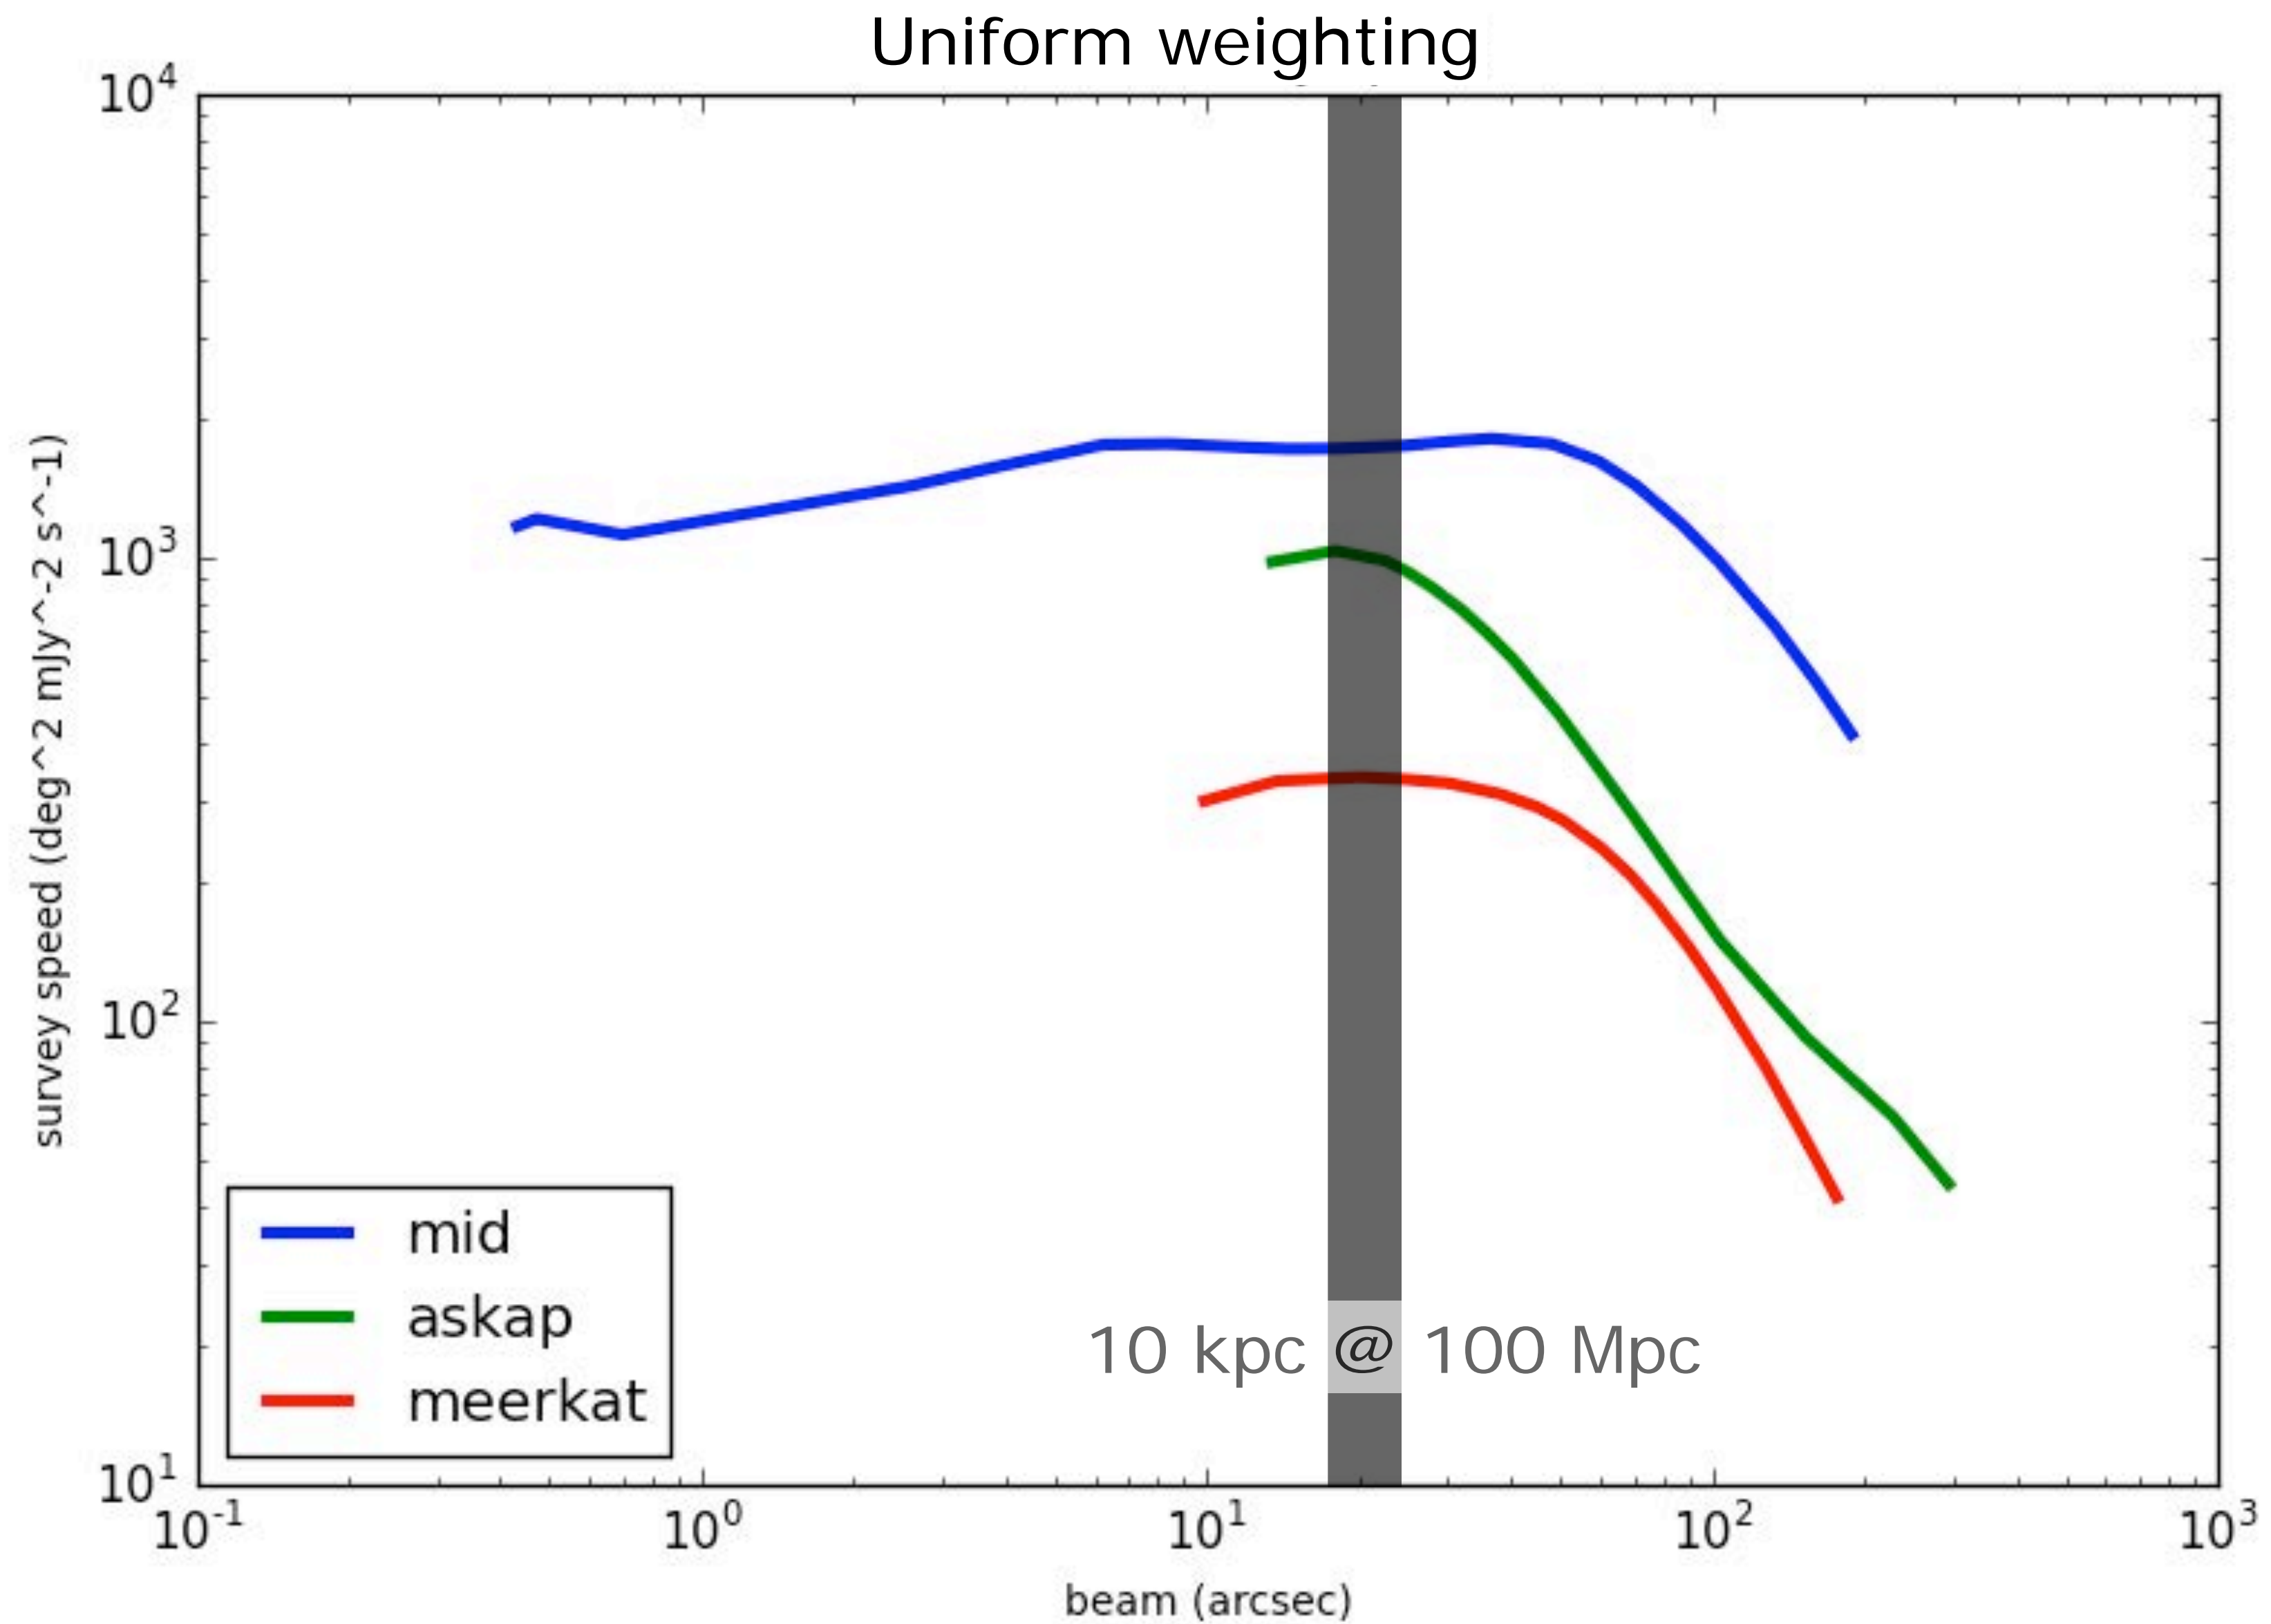

Sensitivity:

$$N(\text{HI}) = 10^{18} \text{ cm}^{-2}$$

$$M(\text{HI}) = 10^5 M_{\odot}$$

“re-baselined” plot from Popping et al. (2015) SKA chapter

ASKAP imaging of HI in IC 1459

Summary

- HI at $\sim 10^{19} \text{ cm}^{-2}$ reveals fundamental processes driving galaxy evolution and invisible at other wavelengths
- SKA1/ASKAP $\sim 10^3 \text{ deg}^2$ blind HI surveys will for the first time build a complete observational picture of these processes out to $z \sim 0.1$
