 - Summary

Just one additional scalar coupled with generic couplings $g_q y_i, y_\chi$

$$\mathcal{L}_{new} = \frac{1}{2} \partial^\mu S \partial_\mu S - \frac{1}{2} M^2 S^2 - \frac{g_q}{\sqrt{2}} S \sum_q y_i \bar{q}_i q_i - y_{DM} S \bar{\chi} \chi$$

The interaction term of S with quarks is not gauge invariant, as

$$\bar{q}_i q_i = \bar{q}_L^i q_R^i + \bar{q}_R^i q_L^i$$

is not SM singlet

Assumptions

- S is a scalar, and is a portal to DM
- χ is a SM singlet
- S is exchanged in the s-channel
- Structure of SM yukawa lagrangian is not modified
- There is only one Higgs doublet

Implications

- S is a SM singlet
- S has to mix with SM higgs, as a quark scalar bilinear can only couple to a particle that has the same quantum numbers as an Higgs doublet

Introduction

A possible Gauge invariant version

A Gauge invariant version of this model could be obtained by the following lagrangian (Z_2 on S)

$$\mathcal{L}_{new} = \frac{1}{2} \partial^\mu S \partial_\mu S + \frac{1}{2} M_{SS}^2 S^2 - \frac{1}{2} \lambda_{HS} \phi^\dagger \phi S^2 - \frac{1}{4!} \lambda_S S^4 - y_{DM} S \bar{\chi} \chi$$

EW symmetry breaking mixes the SM higgs with the new scalar

$$\begin{pmatrix} h \\ s \end{pmatrix} = \begin{pmatrix} \cos \epsilon & \sin \epsilon \\ -\sin \epsilon & \cos \epsilon \end{pmatrix} \begin{pmatrix} h' \\ S \end{pmatrix}$$

The mixing angle ϵ has to be small, so that higgs and EW phenomenology does not get affected much (all SM signal strengths involving the higgs get a $\cos^2 \epsilon$ factor)

Consequently, $\cos \epsilon \sim 1$

Introduction

A possible Gauge invariant version

The $h - s$ mixing gives s a coupling to Standard Model fermions:

$$\mathcal{L}_{int} = -y_i \bar{Q}_L^i u_R^i \tilde{\phi} = -m_i \bar{u}_L^i u_R^i \left(1 + \cos \epsilon \frac{h}{v} - \sin \epsilon \frac{s}{v}\right)$$

The coupling of s to quarks is indeed proportional to yukawas

$$g_q = -\sin \epsilon$$

Both mediators therefore contribute to all cross sections:

$$\sigma_{\bar{q}q \rightarrow \bar{\chi}\chi + X} \propto (y_\chi y_q \sin \epsilon \cos \epsilon)^2 \left(\frac{1}{s - M_h^2} - \frac{1}{s - M_s^2} \right)^2$$

The mixing requires also the Higgs to couple to DM, and the product of the couplings for h and s is equal and opposite

- 3 Conclusions
 - Summary

Introduction

Consequences of Gauge Invariance

- $g_q = \sin \epsilon \leq 1$ means low to moderate sensitivity
- Higgs couples to DM
- Stringent DD constraints on ϵ , even $M_s \rightarrow \infty$ (but not for $M_s \sim M_h$)
- DD blind window at $M_s \sim M_h$ [1509.05771]
- Too weak signal at LHC unless at least one of the 2 mediators can go on shell
- Bounds on h invisible give stringent constraints for $m_\chi \lesssim M_h/2$
- VBF operator arises

$$L_{int,VBF} = -\sin \epsilon \left(2 \frac{M_W^2}{v} W_\mu^+ W^{-\mu} + \frac{M_z^2}{v} Z_\mu Z^\mu \right) s$$

Going Beyond: 2HDM

Adding a second doublet

- Conclusions of the previous slides are quite general
 - A more complex scalar sector would still lead to similar conclusions
- To get more freedom with couplings to quarks, the only way is to add an additional Higgs doublet
- New Lagrangian will contain the singlet S as well, for a total of 3 scalars

$$\begin{aligned} V(\Phi_1, \Phi_2, S) &= M_{11}^2 \Phi_1^\dagger \Phi_1 + M_{22}^2 \Phi_2^\dagger \Phi_2 + (M_{12}^2 \Phi_2^\dagger \Phi_1 + h.c.) \\ &+ \frac{\lambda_1}{2} (\Phi_1^\dagger \Phi_1)^2 + \frac{\lambda_2}{2} (\Phi_2^\dagger \Phi_2)^2 + \lambda_3 (\Phi_1^\dagger \Phi_1) (\Phi_2^\dagger \Phi_2) \\ &+ \lambda_4 (\Phi_2^\dagger \Phi_1) (\Phi_1^\dagger \Phi_2) + \frac{1}{2} \left(\lambda_5 (\Phi_2^\dagger \Phi_1)^2 + h.c. \right), \\ &+ \frac{1}{2} M_{SS}^2 S^2 + \frac{1}{3} \mu_S S^3 + \frac{1}{4} \lambda_S S^4 \\ &+ \frac{\lambda_{11S}}{2} (\Phi_1^\dagger \Phi_1) S^2 + \frac{\lambda_{22S}}{2} (\Phi_2^\dagger \Phi_2) S^2 + \frac{1}{2} (\lambda_{12S} \Phi_2^\dagger \Phi_1 S^2 + h.c.) \end{aligned}$$

Going Beyond: 2HDM

Scalars Mixing

- The 3 scalars will in general mix with arbitrary mixing angles
 - There is always a region of the parameter space where one can decouple the first doublet and make it SM-like $\cos(\beta - \alpha) = 0$
 - This region may rise up naturally in presence of some symmetries of the full UV model
 - In that case S mixes only with the scalar of the second doublet, and there is no constraints on the mixing angle
 - SM phenomenology doesn't get affected in this limit, and no VBF operator arises

Going Beyond: 2HDM

Natural Alignment

- In 2HDM, natural alignment arises in presence of the symmetry

$$\lambda_1 = \lambda_2 = \frac{1}{2} (\lambda_3 + \lambda_4 + \lambda_5)$$

- Under such symmetry, rotating the doublets of an angle β leave the couplings $\lambda_{1,\dots,5}$ invariant

- Rotating in the higgs basis, where $\langle \Phi_1 \rangle = \begin{pmatrix} 0 \\ v \\ \sqrt{2} \end{pmatrix}$ and

$\langle \Phi_2 \rangle = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$ one gets the mass matrix

$$M^\rho = \begin{pmatrix} M_{hh}^\rho & 0 & M_{hS}^\rho \\ 0 & M_{HH}^\rho & M_{HS}^\rho \\ M_{hS}^\rho & M_{HS}^\rho & M_{SS}^\rho \end{pmatrix} \quad (1)$$

- To avoid the SM higgs to mix with the singlet state, one needs to require that in the new basis $\lambda_{11S} = 0$

Going Beyond: 2HDM

Type I and II

In the alignment limit ($\beta - \alpha = \pi/2$), ones gets (neglecting scalar interactions))

$$L = L_{SM} + \frac{1}{2} \partial^\mu S_i \partial_\mu S_i - \frac{1}{2} M_i^2 S_i^2 (i = 1, 2) + \bar{\chi} (i\not{\partial} - m_\chi) \chi \\ - y_{DM} (\cos \theta S_2 + \sin \theta S_1) \bar{\chi} \chi - \frac{y_f \xi^f}{\sqrt{2}} (\cos \theta S_1 - \sin \theta S_2) \bar{f} f$$

	Type I	Type II
ξ^u	$\cot \beta$	$\cot \beta$
ξ^d	$\cot \beta$	$-\tan \beta$
ξ^ℓ	$\cot \beta$	$-\tan \beta$

- Type II can allow an enhanced coupling to down quarks, for large values of $\tan \beta$
- u, d quarks have same-sign couplings in Type I and opposite sign couplings in Type II

Going Beyond: 2HDM

Direct Detection Constraints

Not only interference between the 2 mediators, but also interference between different flavours (Type II)

- 1 Introduction

 - Relic Density and Collider
- 3 Conclusions
 - Summary

Going Beyond: 2HDM

Type III and FCNC

- The most general case is Type III
 - In this case, FCNC generally appear at tree level
- To get rid of them at tree level, one needs flavour-diagonal couplings (in mass eigenstates basis)
- In absence of symmetry, loop level FCNC will appear
- Examples of Yukawa patterns that are "protected" against loop level FCNC:
 - Aligned yukawas: $y_H^U = \tan \gamma_u y_h^U$, $y_H^D = \tan \gamma_d y_h^D$, $y_H^l = \tan \gamma_l y_h^l$
 - Coupling only to first 2 generations: $y_H^{u,c} = A$, $y_H^{d,s} = B$, $y_H^{b,t,l} = 0$

Going Beyond: 2HDM

Direct Detection Constraints

Interference between flavours only happens for a certain ratio between the yukawa couplings

Going Beyond: 2HDM

Relic Density and Collider

- Rich phenomenology and highly dependent on the mass spectrum
- Relic Density: can be obtained with
 - Scalar/gauge only annihilations ($\chi\bar{\chi} \rightarrow S_i S_i, S_i Z, S_i h, H^+ W^-$)
 - Fermion-only annihilations ($\chi\bar{\chi} \rightarrow f\bar{f}$) (might require "large" couplings or resonant enhancement)
 - Mixture of the two
- Collider: other than monojet, certain mass spectrums allow resonant production and decay to get large mono-higgs/mono- Z signals

NFC	N/D	Yes	Yes	No
MFV	Yes	Yes	Yes	Yes
Flavour constr.	No	Moderate	Moderate	Depends

Conclusions

Summary

- Single scalar mediator
 - not gauge invariant wrt SM symmetries
- Singlet mixed with SM Higgs
 - Simple model, can be studied in details without "simplifying" it
 - Many constrains from SM physics
 - Negative interference in DD for degenerate mediators
- Singlet plus 2 Higgs doublets
 - Necessary to go beyond the above
 - Interesting case in the alignment limit
 - S mixes with 2nd Higgs, thus no Higgs mixing constraints
 - Negative interference in DD also from flavour interference
 - Flavour diagonal (*but not necessarily Yukawa suppressed*) couplings forbid tree-level FCNC
 - Arbitrary diagonal couplings allow large LHC signals
 - Large parameter space for Type III can be "simplified" with flavor constrains
